Project No. 20231340

LSA

May 2025

EXECUTIVE SUMMARY

The purpose of this Comprehensive Traffic Study is to determine potential Short-Term, Long-Range, and Buildout level of service (LOS) impacts and California Environmental Quality Act (CEQA) transportation impacts (vehicle miles traveled [VMT]) resulting from the proposed Irvine Gateway Village Project (project) in Planning Area 2 (PA 2) in Irvine, California.

The project site is located north of Portola Parkway, east of Jeffrey Road, south of State Route 241 (SR-241), and west of Bee Canyon Access Road. The proposed project includes approximately 1,360 residential units (408 single-family detached units and 952 multi-family units) on a 105.4-acre vacant parcel. It should be noted that the 105.4-acre parcel represents the entire project site, which includes 77.6 acres for the proposed residential development, 9.5 acres for the proposed Jeffrey Open Space Trail (JOST) extension, 4.8 acres for the proposed South Park, and 13.5 acres of Orange County land area by Bee Canyon Access Road. Twenty-five (25) percent (340 units) of the total proposed units are affordable multi-family housing units. The public park (South Park), located at the northwest corner of the project site, is included as a part of the proposed project. This is part of a larger public park/open space area (approximately 100 acres) to be created by the City based on the removal of the former All American Asphalt plant. The proposed project will be completed in a single phase.

A proposed extension of the JOST would form the western edge of the project site and would connect to the new South Park. A pedestrian bridge would cross over Portola Parkway as part of the JOST extension. A sidewalk on the north side of Portola Parkway along the project property frontage is proposed as a project design feature.

Access to the project site will be provided via three full-access driveways on Jeffrey Road and a right-in/right-out (RIRO) driveway on Portola Parkway.

Based on the City of Irvine (City) *Traffic Study Guidelines* (March 21, 2023), a comprehensive Traffic Study is required to evaluate the cumulative effects with buildout of the proposed project.

This study focuses on the a.m. peak-hour and p.m. peak-hour LOS at intersections, freeway/tollway ramps, and freeway/tollway mainline segments, and daily LOS at arterial roadway segments within the North Irvine Transportation Mitigation (NITM) boundary, which was reviewed and confirmed with City staff prior to the analysis. The project LOS impacts were determined based on analysis of the following scenarios:

- Short-Term Interim-Year Approved Baseline
- Short-Term Interim-Year Approved Baseline Plus Project
- Long-Range Approved Baseline
- Long-Range Approved Baseline Plus Project
- Buildout Approved Baseline
- Buildout Approved Baseline Plus Project
- Buildout Pending Baseline
- Buildout Pending Baseline Plus Project

Based on the results of the LOS analysis, the proposed project results in an LOS impact at the following locations, and the corresponding physical improvements are required:

- **I-5 Southbound (SB) On-Ramp at Jeffrey Road under the Long-Range Approved Scenario:** The conversion of the high-occupancy vehicle (HOV) preferential on-ramp to a second metered mixed-flow lane at this ramp location will increase the on-ramp capacity and reduce the project's LOS impact. This is identified as an NITM partially funded improvement. The project will participate in the implementation of this proposed mitigation improvement on a fair-share basis to mitigate its impact, and a 1.62 percent fair-share contribution would be required.

A site access analysis, consistent with the City's Transportation Design Procedures (TDPs), was conducted for the project for both Existing and Buildout Approved scenarios. The summary of access analysis results for each scenario has been described below.

EXISTING BASELINE AND PLUS PROJECT SCENARIO

This scenario does not include the Jeffrey Road extension. Under this scenario, Jeffrey Road between Portola Parkway and C Street was recently constructed as a four-lane Primary roadway and it terminates near C Street (approximately 3,100 feet north of Portola Parkway). The cross section of Jeffrey Road includes an on-street bike lane on both sides of the street and a northbound (NB) de-facto right-turn lane at each project driveway (which would satisfy TDP-4 criteria). No impacts to vehicle access were identified using the following design guidelines with recommendations and justification provided in the report:

- **TDP-1:** Turn Lane Pocket Lengths
- **TDP-3:** Left-Turn In/Out Access
- **TDP-4:** Right-Turn Lanes at Uncontrolled Driveways
- **TDP-10:** Distance Between Driveways and Intersections
- **TDP-14:** Driveway Lengths

A traffic signal is not warranted based on expected traffic conditions at any of the proposed project access points from Jeffrey Road in this scenario, per TDP-12 criteria. A one-way stop control is proposed for A, B, and C Streets at Jeffrey Road in the existing condition.

BUILDOUT APPROVED BASELINE AND PLUS PROJECT SCENARIO

This scenario does include the Jeffrey Road extension from C Street to SR-241 and further north to Santiago Canyon Road. Under this scenario, a traffic signal would be warranted and recommended at A Street on Jeffrey Road to satisfy both TDP-3 and TDP-12 criteria. In addition to a four-lane Primary facility for Jeffrey Road, a NB de-facto right-turn lane is provided at A, B, and C Streets on Jeffrey Road to satisfy TDP-4 criteria. No impacts to vehicle access were identified using the following design guidelines with the recommendations and justification provided in this report:

- **TDP-1:** Turn Lane Pocket Lengths
- **TDP 3:** Left-Turn In/Out Access
- **TDP 4:** Right-Turn Lanes at Uncontrolled Driveways

- **TDP-10:** Distance Between Driveways and Intersections
- **TDP-14:** Driveway Lengths

A traffic signal is warranted at A, B, and C Streets on Jeffrey Road in this scenario, per TDP-12 criteria. However, only a traffic signal at A Street is recommended based on several factors, including the distance between driveways, the peak-hour traffic volumes primarily at A Street, and the internal circulation (i.e., D Street) that would allow project vehicles to access the proposed signal at A Street. A one-way stop control is proposed for B and C Streets at Jeffrey Road in the buildout condition.

The proposed project would maintain the existing walkways/sidewalks, on-street (Class II) bicycle lanes, and JOST in the vicinity of the project site (i.e., south of Portola Parkway). A proposed extension of the JOST would form the western edge of the project site and would connect to the new South Park. A pedestrian bridge would cross over Portola Parkway as part of the JOST extension. The JOST extension would mark the northernmost end of the JOST, which runs through Irvine. A sidewalk on the north side of Portola Parkway along the project property frontage is proposed as a project design feature. There are no transit routes or stops within 0.5 mile of the project site in the existing condition. The closest bus stops are located at the northwest and southwest corners of Jeffrey Road/Irvine Boulevard, which are approximately 1 mile from the project site. The updated site plan provided by the developer will include a new transit stop and bus turnout on Jeffrey Road at approximately the northeast corner of Jeffrey Road and C Street. This new transit stop will serve the expanded Irvine CONNECT route, to be implemented by the City, with the extension going adjacent to the Irvine Gateway project.

Based on the City's *Traffic Study Guidelines*, the proposed project is required to reduce its VMT by 25.7 percent and is presumed to have a significant CEQA transportation impact. Three applicable VMT mitigation measures identified from the *CAPCOA Handbook*, as well as the City's *Traffic Study Guidelines*, include T-4 (Integrate Affordable and Below Market Rate Housing), T-18 (Provide Pedestrian Network Improvement), and T-20 (Expand Bikeway Network). Assuming each mitigation measure could achieve its maximum VMT reduction value, the implementation of those three mitigation measures could reduce VMT by a total of 9.5 percent, which is less than the project's VMT impact of 25.7 percent. As a result, the proposed project will have a significant unavoidable VMT impact. Therefore, a Statement of Overriding Considerations must be considered for adoption and is a part of the CEQA document (Environmental Impact Report [EIR]) prepared for this project.

COMPREHENSIVE TRAFFIC STUDY
IRVINE GATEWAY VILLAGE

LSA has prepared the following Comprehensive Traffic Study to identify the potential Short-Term, Long-Range, and Buildout level of service (LOS) impacts and California Environmental Quality Act (CEQA) transportation impacts (vehicle miles traveled [VMT]) resulting from the proposed Irvine Gateway Village Project (project) in Planning Area 2 (PA 2) in Irvine, California.

LSA has prepared this Comprehensive Traffic Study consistent with the approved Scope of Work, dated August 15, 2024 (provided in Appendix A). This Traffic Study was prepared in accordance with the applicable sections of the City of Irvine (City) *Traffic Study Guidelines* (March 21, 2023), North Irvine Transportation Mitigation (NITM) City Council Ordinance 03-61 (May 2003) (NITM Ordinance), and Transportation Design Procedures (TDPs) (February 2007).

INTRODUCTION

Project Site

The project site is located north of Portola Parkway, east of Jeffrey Road, south of State Route 241 (SR-241), and west of Bee Canyon Access Road, as shown on Figure 1. The project site is currently undeveloped.

The proposed project includes 1,360 residential units (408 single-family detached units and 952 multi-family units) on a 105.4-acre vacant parcel. It should be noted that the 105.4-acre parcel represents the entire project site, which includes 77.6 acres for the proposed residential development, 9.5 acres for the proposed Jeffrey Open Space Trail (JOST) extension, 4.8 acres for the proposed South Park, and 13.5 acres of Orange County land area by Bee Canyon Access Road. Twenty-five (25) percent (340 units) of the total proposed units are affordable multi-family housing units. The public park (South Park), located at the northwest corner of the project site, is included as a part of the proposed project. This is part of a larger public park/open space area (approximately 100 acres) to be created by the City based on the removal of the former All American Asphalt plant. The proposed project will be completed in a single phase.

A proposed extension of the JOST would form the western edge of the project site and would connect to the new South Park. A pedestrian bridge would cross over Portola Parkway as part of the JOST extension. The JOST extension would mark the easternmost end of the JOST, which runs through Irvine. A sidewalk on the north side of Portola Parkway along the project property frontage is proposed as a project design feature.

Access to the project site will be provided via three full-access driveways on Jeffrey Road and a right-in/right-out (RIRO) driveway on Portola Parkway. A conceptual plan of the proposed project is provided on Figure 2. The applicant is currently in the process of developing a detailed site plan and results of this traffic study will be incorporated into the final site plan.

Irvine Gateway Village

Conceptual Site Plan

I:\2023\20231340\G\Site_Plan.ai (05/19/2025)

Study Area

Figure 1 illustrates the NITM study area reviewed and confirmed with City staff prior to the analysis. The NITM study is generally bounded by SR-241 to the north, SR-73 to the south, Newport Avenue (in Tustin) to the west, and Alicia Parkway (in Mission Viejo) to the east.

Intersections, arterial roadway segments, freeway/tollway ramps, and freeway/tollway mainline segments within the NITM study area have been analyzed in this study. Figure 3 illustrates the interchange locations where freeway/tollway ramps and mainlines were analyzed. Project driveways are evaluated as part of the Access Analysis section provided later in this report.

Existing, General Plan, and Proposed Site Uses

The 2045 *Irvine General Plan* (*General Plan*) designation for the site is Recreation, and the current zoning is 1.5 Recreation. The proposed project is a residential use and therefore requires a zone change. A General Plan Amendment is concurrently proposed to support this residential development and ensure consistency with the *General Plan*.

PERFORMANCE CRITERIA

The study area analyzed in this report is under jurisdiction of the City of Aliso Viejo, City of Irvine, City of Laguna Beach, City of Laguna Hills, City of Laguna Woods, City of Lake Forest, City of Mission Viejo, City of Orange, County of Orange, and City of Tustin.

The performance criteria of each jurisdiction in which a given facility, including intersections, arterial roadways, freeway/tollway ramps and mainline segments, is located has been applied in this study. As required in the City's NITM Ordinance, the performance standards applied in this study are consistent with those approved in the 2003 *NITM Program Nexus Study*.

Intersections

Intersection Capacity Utilization (ICU)

To determine the peak-hour operations at signalized intersections within the study area, the intersection capacity utilization (ICU) methodology was used. The ICU methodology compares the volume-to-capacity (v/c) ratios of conflicting turn movements at an intersection, sums these critical conflicting v/c ratios for each intersection approach, and determines the overall ICU. The resulting ICU is expressed in terms of LOS, where LOS A represents free-flow activity and LOS F represents overcapacity operation. The relationship of ICU to LOS is demonstrated in the following table:

Level of Service	ICU
A	0.00–0.60
B	0.61–0.70
C	0.71–0.80
D	0.81–0.90
E	0.91–1.00
F	>1.00

Source: *Traffic Study Guidelines* (City of Irvine 2023).
ICU = intersection capacity utilization

Irvine Gateway Village

Freeway/Tollway Interchange Analysis Location

SOURCE: Irvine Transportation Analysis Model Version 1.8 (2024).

P:\2023\20231340 - Irvine Gateway\GIS\ADT Maps\ADT_Maps\Feasibility ADT_Maps.aprx (12/24/2024)

Parameters set for each city for ICU calculations, including lane capacity, right-turn treatments, and clearance intervals, are included as follows:

- **Saturation Flow Rate**: 1,700 vehicles/hour/lane
- **Clearance Interval:** 0.05
- **Right-Turn-On-Red Utilization Factor:** 0.00 for County of Orange intersections, 0.75 for intersections in all other jurisdictions. It should be noted that "de-facto" right-turn lane is assumed in the ICU calculation if 19 feet from edge to outside of through-lane exists and parking is prohibited during peak periods.

Highway Capacity Manual (HCM)

In addition to the ICU methodology of calculating intersection LOS, an operational analysis was also prepared based on the *Highway Capacity Manual* (HCM), 7th Edition (TRB 2022) to determine the LOS at unsignalized intersections and signalized California Department of Transportation (Caltrans) study area intersections where the project trip distribution is higher than 2 percent. The HCM (7th Edition) intersection methodology presents LOS in terms of total intersection delay (in seconds per vehicle) and approach delay of the major and minor streets (in seconds per vehicle). The resulting delay is expressed in terms of LOS, similar to the ICU methodology. The following table demonstrates the relationship of delay to LOS:

Level of Service	Signalized Intersection Delay (seconds per vehicle)	Unsignalized Intersection (seconds per vehicle)
A	≤10.0	≤10.0
B	>10.0 and ≤20.0	>10.0 and ≤15.0
C	>20.0 and ≤35.0	>15.0 and ≤25.0
D	>35.0 and ≤55.0	>25.0 and ≤35.0
E	>55.0 and ≤80.0	>35.0 and ≤50.0
F	>80.0	>50.0

Source: *Highway Capacity Manual* (TRB 2022).
TRB = Transportation Research Board

Performance Standard

According to the City's *Traffic Study Guidelines* and consistent with the City's *General Plan*, LOS at an intersection or roadway is considered to be unsatisfactory when the ICU (or v/c ratio) exceeds 0.90 (i.e., LOS D). The same LOS standard is applied to the study area intersections in the other adjacent jurisdictions. However, LOS E (v/c ratios less than or equal to 1.00) is considered as an acceptable LOS for the intersection locations listed below:

- The following Orange County Congestion Management Program (CMP) identified intersections are within the study area boundary:
    - 125: Jamboree Road/Irvine Boulevard
    - 133: Jamboree Road/Edinger Avenue
    - 322: Laguna Canyon Road/SR-73 Northbound (NB) Ramps
    - 323: Laguna Canyon Road/SR-73 Southbound (SB) Ramps

- 394: El Toro Road/I-5 NB Ramps
- 396: El Toro Road/Avenida Carlota
- 398: El Toro Road/Moulton Parkway
- 400: El Toro Road/SR-73 NB Ramps
- 401: El Toro Road/SR-73 SB Ramps
- 418: El Toro Road/Trabuco Road

- Irvine Spectrum Center (PA 33)
  - 329: Barranca Parkway/Irvine Center Drive
  - 330: Barranca Parkway/Pacifica
  - 333: Pacifica/Gateway Boulevard
  - 346: Alton Parkway/Enterprise Drive
  - 348: Alton Parkway/Irvine Center Drive
  - 350: Alton Parkway/Pacifica
  - 351: Spectrum Center Drive – I-5 SB Ramps/Enterprise Drive
  - 356: Pacifica/Irvine Center Drive
  - 357: Spectrum Center Drive – I-405 NB Ramps/Entertainment Way
  - 358: Irvine Center Drive/Entertainment Way
  - 359: Irvine Center Drive/I-405 SB Ramps

- Irvine Business Center (PA 36)
  - 135: Jamboree Road/Warner Avenue
  - 136: Jamboree Road/Barranca Parkway

- And the following intersections:
  - 338: Alton Parkway/Irvine Boulevard
  - 362: Bake Parkway/Irvine Boulevard
  - 367: I-5 NB Ramps/Bake Parkway
  - 368: I-5 SB Ramps/Bake Parkway
  - 383: Lake Forest Drive /Avenida Carlota – I-5 SB Ramps
  - 385: Lake Forest Drive/Irvine Center Drive
  - 569: Bake Parkway/Marine Way

Significant Impact Threshold

For an ICU greater than the acceptable LOS, operational improvements would be required to bring the intersection LOS back to acceptable LOS or back to No Project conditions if the project contribution is: (a) greater than 0.03 at CMP locations outside Irvine (the impact threshold specified in the CMP); (b) 0.02 or greater at locations in Aliso Viejo, Irvine, Laguna Hills, Laguna Woods, Lake Forest, Mission Viejo, Orange, and Tustin; and (c) 0.01 or greater at County of Orange locations (the impact threshold specified in the County of Orange Growth Management Plan [GMP]).

Arterial Roadways

Average daily traffic (ADT) v/c ratios were calculated to evaluate the performance for the arterial roadways within the study area. The resulting v/c ratio is expressed in terms of LOS, where LOS A represents free-flow activity and LOS F represents overcapacity operation. The following table summarizes the v/c ranges for LOS A through LOS F for arterial roadways. The v/c ranges listed for arterial roads are designated in the CMP as well as the *General Plan* and for the other jurisdictions within the study area.

Level of Service	ICU
A	0.00–0.60
B	0.61–0.70
C	0.71–0.80
D	0.81–0.90
E	0.91–1.00
F	>1.00

Source: *Traffic Study Guidelines* (City of Irvine 2023).
ICU = intersection capacity utilization

Arterial roadway ADT v/c ratios were calculated using the following capacities.

City of Irvine. Roadway link v/c ratios were determined using the City's theoretical daily capacities. Facility types were taken from the City's *General Plan*. The following table illustrates theoretical daily capacities (as contained in the City's *Traffic Study Guidelines*) for roadways within the study area:

Facility Type	Number of Lanes	Theoretical Capacity (vehicles per day)
Major Highway	8	72,000
	7	63,000
	6	54,000
Primary Highway	4	32,000
Secondary Highway	4	28,000
Commuter	2	13,000

Sources: *2045 Irvine General Plan Circulation Element* (City of Irvine 2024) and *Traffic Study Guidelines* (City of Irvine 2023).
Note: The theoretical capacity of a seven-lane Major Highway is interpolated from the theoretical capacities of a six-lane and an eight-lane Major Highway.

City of Orange. The following table illustrates theoretical daily capacities for roadways within the study area:

Facility Type	Number of Lanes	Theoretical Capacity (vehicles per day)
Major Arterial	8	75,000
	6	56,300
Primary Arterial	4	37,500
Secondary Arterial	4	24,000
Commuter	2	12,000

Sources: *Traffic Study Guidelines* (City of Irvine 2023).

City of Orange and Cities of Aliso Viejo, Laguna Hills, Laguna Woods, Lake Forest, Mission Viejo, and Tustin. The following table illustrates theoretical daily capacities for roadways within the study area:

Facility Type	Number of Lanes	Theoretical Capacity (vehicles per day)
Major Arterial	8	75,000
	6	56,300
Primary Arterial	4	37,500
Secondary Arterial	4	25,000
Commuter	2	12,500

Performance Standard

Similar to criteria utilized for study-area intersections, LOS at a CMP, Irvine Business Complex (PA 36), or Irvine Spectrum Center (PA 33) roadway segment is considered to be deficient when the v/c ratio exceeds 1.00 (i.e., LOS E). All other roadway segments will be considered deficient when the v/c ratio exceeds 0.90 (i.e., LOS D).

Consistent with the City's *Traffic Study Guidelines*, a peak-hour roadway segment analysis will be conducted for all roadway segments that exceed the acceptable LOS standards described previously. The peak-hour capacity will be determined by multiplying the midblock number of lanes for each direction by a lane capacity of 1,600 vehicles per hour (vph). Where the distance between controlled intersections is 1 or more miles, the midblock number of lanes shall be multiplied by a lane capacity of 2,000 vph.

Significant Impact Threshold

For v/c greater than the acceptable LOS, mitigation of the project contribution is required to bring arterial roadway LOS back to acceptable LOS or to No Project conditions if the project contribution is greater than 0.03 for CMP roadways outside Irvine (the impact threshold specified in the CMP), 0.01 or greater for locations in Orange County, and 0.02 or greater for all other arterial roadways in the study area.

Freeway/Tollway Ramps

LOS at freeway/tollway ramps were analyzed based on peak-hour v/c ratios. The resulting v/c ratio is expressed in terms of LOS, where LOS A represents free-flow activity and LOS F represents overcapacity operation. The following table summarizes the v/c ranges for LOS A through LOS F for freeway/tollway ramps.

Level of Service	ICU
A	0.00–0.60
B	0.61–0.70
C	0.71–0.80
D	0.81–0.90
E	0.91–1.00
F	>1.00

Source: *Traffic Study Guidelines* (City of Irvine 2023).
ICU = intersection capacity utilization

Peak-hour v/c ratios on freeway/tollway ramps were calculated based on the following capacities:

- **Metered On-Ramps**
  - 900 vph for a one-lane metered on-ramp with only one mixed-flow lane at the meter
  - 1,080 vph for a one-lane metered on-ramp with one mixed-flow lane at the meter plus one high-occupancy vehicle (HOV) preferential lane at the meter
  - 1,500 vph for a one-lane metered on-ramp with two mixed-flow lanes at the meter
  - 1,800 vph for a two-lane metered on-ramp with two mixed-flow lanes at the meter
- **Toll Ramps (On-Ramps and Off-Ramps)**
  - 1,500 vph for a one-lane ramp with one cash (stopped) lane and one FasTrak (unstopped) lane
- **Non-Metered On-Ramps and Off-Ramps**
  - 1,500 vph for a one-lane ramp
  - 2,250 vph for a two-lane on-ramp that tapers into one merge lane at or beyond the freeway mainline gore point and for a two-lane off-ramp with only one auxiliary lane
  - 3,000 vph for a two-lane on-ramp that does not taper to one merge lane and for a two-lane off-ramp with two auxiliary lanes
- **Freeway to Freeway and Freeway to Tollway Interchanges**
  - 2,000 vph for a one-lane ramp
  - 4,000 vph for a two-lane ramp

Performance Standard

Freeway/tollway ramps will be considered to be deficient when the v/c ratio exceeds 1.00 (i.e., LOS E).

Significant Impact Threshold

For freeway/tollway ramps with the v/c ratio greater than the acceptable LOS, mitigation of the project contribution is required to bring ramp LOS back to acceptable LOS or no-project conditions if the project contribution is greater than 0.03 for ramps at CMP intersections outside Irvine (the impact threshold specified in the CMP), 0.01 or greater for ramps at Orange County intersections (the impact threshold specified in the GMP), and 0.02 or greater for ramps at intersections in all other jurisdictions in the study area.

Freeway/Tollway Mainline Segments

LOS at freeway/tollway mainline segments were analyzed based on peak-hour v/c ratios. The resulting v/c ratio is expressed in terms of LOS, where LOS A represents free-flow activity and LOS F represents overcapacity operation. The following table summarizes the v/c ranges for LOS A through LOS F for freeway/tollway mainline segments. The v/c ranges listed for freeway/tollway segments are based on the v/c and LOS relationships specified in the HCM (6th Edition) for basic freeway sections.

Level of Service	ICU
A	0.00–0.30
B	0.31–0.50
C	0.51–0.71
D	0.72–0.89
E	0.90–1.00
F	>1.00

Source: *Highway Capacity Manual*, 6th Edition (TRB 2016).
ICU = intersection capacity utilization
TRB = Transportation Research Board

Peak-hour v/c ratios on freeway/tollway mainline segments were calculated based on the following capacities:

- 2,000 vehicles per hour per lane (vphpl) for mixed-flow (general-purpose) lanes
- 1,600 vphpl for a one-lane, buffer-separated HOV facility
- 1,750 vphpl for a two-lane, buffer-separated HOV facility

Performance Standard

Freeway/tollway mainline segments will be considered to be deficient when the v/c ratio exceeds 1.00 (i.e., LOS E).

Significant Impact Threshold

For freeway/tollway mainline segments with the v/c ratio greater than the acceptable LOS, mitigation of the project contribution is required to bring freeway/tollway mainline segment LOS back to acceptable LOS or to baseline conditions if the project contribution is greater than 0.03 (i.e., the impact threshold specified in the CMP).

ANALYSIS METHODOLOGY AND APPROACH

The TransCAD version of the Irvine Transportation Analysis Model (ITAM TC Version 1.8 [V1.8]) was used to forecast Short-Term, Long-Range, and Buildout Approved and Buildout Pending conditions with and without the proposed project. The Approved condition represents each application for development currently approved by the City. The Pending condition represents the planned growth for Irvine per the *General Plan,* as well as for all projects in Irvine that are approved (but not yet built) and currently under review.

The future conditions are based on the funded roadway network and land use assumptions envisioned to be in place by the respective horizon year. This future traffic analysis requires eight ITAM TC runs. These ITAM TC runs are examined with and without the proposed project in both the Approved and Pending development scenario. In addition, as requested by City staff, a 100-acre public park/open space use, inclusive of the 4.8-acre South Park, is also assumed in the Approved and Pending with project scenarios to represent a conservative LOS analysis.

LSA prepared the forecast data for this proposed project based on the ITAM TC V1.8. The scenarios examined for each future condition are as follows:

1. **Short-Term Interim-Year Approved Baseline:** The ITAM TC V1.8 run includes each application for development approved by the City. Any additional development beyond the existing uses for the proposed project that might be assumed in the ITAM TC V1.8 was deleted for the analysis of this scenario.

2. **Short-Term Interim-Year Approved Baseline Plus Project:** The ITAM TC V1.8 run includes each application for development approved by the City. The proposed 1,360 residential units (408 single-family detached units and 952 multi-family units) and the 100-acre public park/open space, inclusive of the 4.8-acre South Park, are conservatively assumed to be built in this scenario.

3. **Long-Range Approved Baseline:** The ITAM TC V1.8 run includes each application for development approved by the City. Any additional development beyond the existing uses for the proposed project that might be assumed in the ITAM TC V1.8 was deleted for the analysis of this scenario.

4. **Long-Range Approved Baseline Plus Project:** The ITAM TC run V1.8 includes each application for development approved by the City. The proposed 1,360 residential units (408 single-family detached units and 952 multi-family units) and the 100-acre public park/open space, inclusive of the 4.8-acre South Park, are conservatively assumed to be built in this scenario.

5. **Buildout Approved Baseline:** The ITAM TC V1.8 run includes each application for development approved by the City. Any additional development beyond the existing uses for the proposed project that might be assumed in the ITAM TC V1.8 was deleted for the analysis of this scenario.

6. **Buildout Approved Baseline Plus Project:** The ITAM TC V1.8 run includes each application for development approved by the City. The proposed 1,360 residential units (408 single-family detached units and 952 multi-family units) and the 100-acre public park/open space, inclusive of the 4.8-acre South Park, are conservatively assumed to be built in this scenario.

7. **Buildout Pending Baseline:** The ITAM TC V1.8 run includes the cumulative effects of each application for development currently approved and under review by the City. Any additional development beyond the existing uses for the proposed project that might be assumed in the ITAM TC V1.8 was deleted for the analysis of this scenario.

8. **Buildout Pending Baseline Plus Project:** The ITAM TC V1.8 run includes the cumulative effects of each application for development currently approved and under review by the City. The proposed 1,360 residential units (408 single-family detached units and 952 multi-family units) and the 100-acre public park/open space, inclusive of the 4.8-acre South Park, are conservatively assumed to be built in this scenario.

Project LOS impacts are identified at study area intersections for the Short-Term, Long-Range, and Buildout Approved and Buildout Pending conditions, assuming improvements to the circulation system identified by the City. Daily traffic volumes and v/c ratios for study area roadway segments, a.m. and p.m. peak-hour traffic volumes, v/c ratios for study-area freeway/tollway ramps, and mainline segments are also presented in the analysis for each scenario. Traffic volumes and calculations for the Short-Term, Long-Range, and Buildout Approved and Buildout Pending scenarios are referenced throughout this Traffic Study and are provided in Appendix B.

PROPOSED PROJECT TRAFFIC

Trip Generation

The project trip generation assigned to the intersections, roadway segments, and freeway/tollway ramps and mainline segments in the study area for the Short-Term, Long-Range, and Buildout Approved and Buildout Pending conditions are based on the ITAM TC, which is the Orange County Transportation Authority (OCTA) sanctioned subarea model for Irvine. All modeling steps (including trip generation, distribution, and assignment) are consistent with the Orange County Traffic Analysis Model (OCTAM). Project traffic, as well as cumulative traffic and growth within Irvine and adjacent cities, is included in the model runs. ITAM TC is the City's approved traffic forecasting tool to use for evaluation of project-related circulation effects within Irvine.

The ITAM trip rates from the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10th Edition (2017), are used for LOS analysis purposes under each forecast condition.

Trip rates contained in the ITE *Trip Generation Manual*, 10th Edition (2017) for Land Use 210 (Single-Family Detached), Land Use 220 (Multifamily Housing [Low Rise]), and Land Use Code 411 (Public Park) are used for access analysis purposes. The land use-based ITE trip rates are only used for evaluation of the City's TDPs, which are provided later in this Traffic Study.

Table A presents the trip generation for the proposed project. As Table A indicates, the proposed project, including 1,360 residential units (408 single-family detached units and 952 multi-family units) and 4.8-acre South Park, would generate 10,825 daily trips in total, including 739 a.m. peak-hour trips (178 inbound and 561 outbound) and 937 p.m. peak-hour trips (586 inbound and 351 outbound).

LSA

Table A: Project Trip Generation Summary

Land Use	Size	Unit	ADT	AM Peak Hour			PM Peak Hour		
				In	Out	Total	In	Out	Total
Trip Rates[1]									
Single-Family Detached		du	9.44	0.18	0.56	0.74	0.62	0.37	0.99
Multi-Family Low-Rise		du	7.32	0.11	0.35	0.46	0.35	0.21	0.56
Public Park		ac	0.78	0.01	0.01	0.02	0.06	0.05	0.11
Project Trip Generation									
Single-Family Detached	408	du	3,852	73	228	301	253	151	404
Multi-Family Low-Rise	952	du	6,969	105	333	438	333	200	533
Public Park	4.9	ac	4	0	0	0	0	0	0
Total:			**10,825**	**178**	**561**	**739**	**586**	**351**	**937**

[1] Trip rates from the Institute of Transportation Engineers (ITE) *Trip Generation* Manual, 10th Edition (2017).

Land Use Code 210 - Single-Family Detached

Land Use Code 220 - Multi-Family Housing (Low Rise) - 2 or 3 Levels

Land Use Code 411 - Public Park

du = dwelling unit

ac = acre

Trip Distribution and Assignment

Directions of approach to and departure from the site are based on the ITAM TC select zone assignments for a.m. peak-hour, p.m. peak-hour, and daily conditions under each horizon year. The model data represent the Baseline traffic volumes plus the trips generated by the proposed project under each project scenario. The ITAM TC Buildout Approved Baseline Plus Project select zone assignments are provided in Appendix C.

The a.m. and p.m. peak-hour Buildout Approved Baseline Plus Project select zone assignments were used to identify the regional trip distribution for the project and assign project trips into and out of the site. The detailed project trip distribution in and out of each project driveway is provided later in the access analysis sections of this Traffic Study. It should be noted that no trip distribution adjustments were made for LOS analysis purposes.

EXISTING CONDITIONS

Existing Site Uses

The project site is located north of Portola Parkway, east of Jeffrey Road, south of SR-241, and west of Bee Canyon Access Road. The project site is currently undeveloped. The project site is designated as Recreation in the City's *General Plan* and zoned as 1.5 Recreation.

Existing Roadways and Intersections

Key roadways in the vicinity of the proposed project are:

- **Jeffrey Road:** Jeffrey Road is a north-south roadway west of the project site. Direct project access via three full-access driveways (A, B, and C Streets) is provided on Jeffrey Road. Jeffrey Road south of Portola Parkway is a six-lane Major Highway with a posted speed limit of 55 miles per hour (mph) between Encore and Portola Parkway. Jeffrey Road north of Portola Parkway, as recently constructed, is a four-lane Primary roadway that terminates near C Street (approximately 3,100 feet north of Portola Parkway). The current road provides access to existing uses, including electrical substations on the west side of Jeffrey Road and the Irvine Ranch Conservancy Native Seed Farm and other small businesses on the east side of Jeffrey Road. The extension of Jeffrey Road from C Street to SR-241 and further north to Santiago Canyon Road is classified as a Primary Highway in the Circulation Element of the City's *General Plan*. On-street parking is prohibited on both sides of this roadway. A sidewalk and Class II bicycle lane are provided on the west side of Jeffrey Road, and a Class II bicycle lane and the JOST are located on the east side of Jeffrey Road. A proposed extension of the JOST would form the western edge of the project site and would connect to the new South Park. A pedestrian bridge would cross over Portola Parkway as part of the JOST extension. The JOST extension would mark the northernmost end of the JOST, which runs through Irvine.

- **Portola Parkway:** Portola Parkway is an east-west roadway south of the project site. Direct project access via an RIRO driveway (E Street) is provided on Portola Parkway. It is a six-lane Major Highway west of Jeffrey Road and a four-lane Primary Highway east of Jeffrey Road. The posted speed limit is 55 mph. On-street parking is prohibited on both sides of this roadway. A

sidewalk is provided on the south side of Portola Parkway, and Class II bicycle lanes are provided on both sides of Portola Parkway. A sidewalk on the north side of Portola Parkway along the project property frontage is proposed as a project design feature.

Existing Traffic Volumes and LOS

The existing peak-hour traffic counts (collected in January and February 2024) for the study area intersections and the daily counts for the study area arterial roadway segments were obtained from the City. For the intersections and roadway segments with 2-day counts, the average of the 2-day counts was used.

Existing peak-hour traffic data for freeway/tollway ramps within the NITM study area were referenced from intersection counts at each location where freeway/tollway ramps intersect with the arterial roadways. For a few ramp locations where intersection counts were not available, the data was obtained from the Caltrans Performance Management System (PeMS), and the highest value of the peak-hour data was used. Those ramp locations are listed below.

- I-5 SB direct on-ramp at Lake Forest Drive
- I-5 NB direct on-ramp at El Toro Road
- I-405 NB direct on-ramp at Irvine Center Drive
- SR-133 NB direct on-ramp at Barranca Parkway

Existing peak-hour traffic data for freeway/tollway mainline segments within the NITM study area were also referenced from PeMS. Data were extracted for typical workdays (Wednesdays through Thursdays, excluding holidays) from February 1, 2024, to April 30, 2024, and the highest value of the peak-hour data was used. The peak-hour traffic counts for the mainline segments on SR-133, south of I-405, were not available on PeMS. Therefore, the existing peak-hour traffic counts at the intersection of Laguna Canyon Road/Old Laguna Canyon Road were used to develop the mainline volumes on SR-133 south of I-405.

Appendix D provides the Existing traffic count data.

Peak-Hour Intersection LOS

As previously discussed, the ICU methodology was used to determine the LOS at study area intersections, and the HCM methodology was used to determine the LOS at unsignalized intersections. In addition, HCM LOS analysis was also conducted for signalized Caltrans intersections where the project trip distribution is higher than 2 percent. The ICU and HCM worksheets are provided in Appendices B and E, respectively.

A summary of Existing intersection LOS is presented in Table B. As Table B indicates, all study area intersections currently operate at satisfactory LOS.

LSA

Table B: Existing Intersection LOS Summary

ITAM Node No.	Intersection	Jurisdiction	LOS E Acceptable?	Baseline			
				AM Peak Hour		PM Peak Hour	
				ICU / Delay	LOS	ICU / Delay	LOS

Δ = change

CMP = Congestion Management Program

Delay is reported in seconds/vehicle.

HCM = Highway Capacity Manual

ICU = Intersection Capacity Utilization

NB = Northbound

SB = Southbound

N/A = Not applicable (unsignalized intersection)

"--" = Not existing in the Existing condition.

[1] It is a two-legged freeflow unsignalized intersection.

[2] It is a roundabout.

Roadway Segment Volumes and LOS

Daily traffic volumes and v/c ratios were evaluated to identify the LOS on the arterial roadway segments within the study area.

Existing ADT volumes and v/c ratios are presented on Figures 4 and 5, respectively. Based on the ADT v/c performance criteria discussed before, all arterial roadway segments in the study area currently operate at satisfactory LOS, except for the following 11 roadway segments:

- Culver Drive between Alton Parkway and I-405 NB Ramps
- Culver Drive between I-405 SB Ramps and University Drive
- Sand Canyon Avenue between Alton Parkway and I-405 NB Ramps
- Bake Parkway between Commercentre Drive and Irvine Boulevard
- Bake Parkway between Jeronimo Road and Muirlands Boulevard
- Bake Parkway between Rockfield Boulevard and I-5 NB Ramps
- Lake Forest Drive between Rancho Parkway and Trabuco Road
- Lake Forest Drive between Rockfield Boulevard and I-5 NB Ramps
- Alicia Parkway between Jeronimo Road and Muirlands Boulevard
- Alicia Parkway between Muirlands Boulevard and I-5 NB Ramps
- Irvine Boulevard between Browning Avenue and Tustin Ranch Road

Peak-Hour Freeway/Tollway Ramp LOS

Peak-hour traffic volumes and v/c ratios were evaluated to identity the LOS at the freeway/tollway ramp locations in the study area. The peak-hour freeway/tollway ramp analysis presented here differs from the previous peak-hour intersection analysis that included ramp intersections with arterial streets. The ramp analysis involves the peak-hour v/c of the ramp itself whereas the intersection analysis involves the ICU value of the ramp intersection with the arterial street.

A summary of Existing freeway/tollway ramp LOS is presented in Table C. As Table C indicates, all freeway/tollway ramp locations in the study area currently operate at satisfactory LOS, except for the I-5 NB direct on-ramp at Alicia Parkway.

Peak-Hour Freeway/Tollway Mainline LOS

Peak-hour traffic volumes and v/c ratios were evaluated to identity the LOS at the freeway/tollway mainline segments by direction in the study area.

A summary of Existing freeway/tollway mainline LOS is presented in Table D. As Table D indicates, all freeway/tollway mainline locations in the study area currently operate at satisfactory LOS, except for the following freeway/tollway mainline segments:

- NB and SB mainline on I-5 north of Newport Avenue
- SB mainline on I-5 north of Tustin Ranch Road
- SB mainline on I-5 north of Alicia Parkway
- SB mainline on I-405 north of Sand Canyon Avenue
- NB mainline on I-405 north of SR-133

FUTURE CONDITIONS

The following discussion presents the results of the Short-Term, Long-Range, and Buildout analysis for Baseline (No Project) and Plus Project conditions.

Short-Term Approved Baseline and Plus Project Traffic Volumes and LOS

Peak-Hour Intersection LOS

Table E presents a summary of the intersection LOS for Short-Term Approved (Baseline and Plus Project) conditions. As Table E indicates, all study area intersections are forecast to operate at satisfactory LOS in the Baseline (No Project) condition, except for the following locations:

- **Intersection # 434:** I-5 SB Ramps/Alicia Parkway (LOS E)
- **Intersection # 464:** SR-241-SR-261 SB Ramps/Chapman Avenue (LOS E)

With the addition of the proposed project in the Short-Term Approved condition, all study area intersections are forecast to continue operating at satisfactory LOS, with the exception of the previously stated study area intersections. However, the intersection v/c ratio increase does not exceed the impact threshold at SR-241-SR-261 SB Ramps/Chapman Avenue. Therefore, the proposed project can be implemented in a Short-Term Approved condition with no peak-hour LOS impact at this location.

As for I-5 SB Ramps/Alicia Parkway, an intersection v/c ratio increase of 0.02 in the a.m. peak hour exceeds the impact threshold. However, an intersection improvement of adding one SB left-turn lane was planned in the Long-Range and Buildout scenarios. As demonstrated later in this study, I-5 SB Ramps/Alicia Parkway, with the intersection improvement of adding one SB left-turn lane, would operate at satisfactory LOS (LOS D) in the Long-Range and Buildout scenarios. In addition, it should be noted that this improvement is currently under construction. Therefore, the proposed project does not require improvements at this deficient intersection in the Short-Term Approved condition.

Roadway Segment Volumes and LOS

The ADT volumes and v/c ratios for Short-Term Approved Baseline (No Project) are illustrated in Figures 6 and 7, respectively. The ADT volumes and v/c ratios for Short-Term Approved Plus Project are illustrated on Figures 8 and 9, respectively.

Based on the ADT v/c performance criteria discussed before, several arterial roadway segments in the study area are forecast to operate deficiently in the Short-Term Approved (Baseline and Plus Project) conditions. However, the ADT v/c ratio increase does not exceed the impact threshold for those arterial roadway segments, with the exception of Jeffrey Road between the I-5 NB Ramps and Roosevelt.

Δ = change

= exceeds City's level of service (LOS) criteria

CMP = Congestion Management Program

Delay is reported in seconds/vehicle.

HCM = Highway Capacity Manual

ICU = Intersection Capacity Utilization

NB = Northbound

SB = Southbound

N/A = Not applicable (unsignalized intersection)

"--" = Not existing in the Short-Term Approved condition.

[1] It is a roundabout.

The peak-hour roadway segment analysis was performed for Jeffrey Road between the I-5 NB Ramps and Roosevelt. The resulting midblock peak-hour v/c ratios for this arterial roadway segment under the Short-Term Approved (Baseline and Plus Project) conditions are summarized in Table F. As the summary table indicates, this arterial roadway segment is forecast to operate at acceptable LOS during the peak hours. Therefore, the proposed project can be implemented in a Short-Term Approved condition with no LOS impacts on arterial roadway segments in the study area.

Table F: Short-Term Approved Arterial Roadway Peak Hour Link Analysis Summary

Roadway Segment	Peak Hour	Direction	Peak-Hour Capacity (Vehicles/Hour)	Baseline			Plus Project			Δ v/c Ratio	Significant LOS Impact?
				Volume	v/c	LOS	Volume	V/C	LOS		
Jeffrey Road (Roosevelt to I-5 NB Ramps)	AM	NB	4,800	910	0.19	A	920	0.19	A	0.00	No
		SB	4,800	2,837	0.59	A	2,888	0.60	A	0.01	No
	PM	NB	4,800	3,362	0.70	B	3,401	0.71	C	0.01	No
		SB	4,800	1,540	0.32	A	1,597	0.33	A	0.01	No

Source: Compiled by LSA (2024).
Δ = change
I-5 = Interstate 5
LOS = level of service
NB = northbound
SB = southbound
v/c = volume-to-capacity ratio

Peak-Hour Freeway/Tollway Ramp LOS

A summary of freeway/tollway ramp LOS for Short-Term Approved (Baseline and Plus Project) is presented in Table G.

Based on the v/c performance criteria discussed above, the I-405 SB off-ramp at Sand Canyon Avenue in the study area is forecast to operate deficiently in the Short-Term Approved (Baseline and Plus Project) conditions. However, the v/c ratio increase does not exceed the impact threshold for this ramp location. Therefore, the proposed project can be implemented in a Short-Term Approved condition with no peak-hour LOS impacts on freeway/tollway ramps in the study area.

Peak-Hour Freeway/Tollway Mainline LOS

A summary of freeway/tollway mainline LOS for Short-Term Approved (Baseline and Plus Project) is presented in Table H.

Based on the v/c performance criteria discussed before, several freeway/tollway mainline segments in the study area are forecast to operate deficiently in the Short-Term Approved (Baseline and Plus Project) conditions. However, the v/c ratio increase does not exceed the impact threshold for those mainline locations. Therefore, the proposed project can be implemented in a Short-Term Approved condition with no peak-hour LOS impacts on freeway/tollway mainline segments in the study area.

= exceeds level of service (LOS) criteria

V/C = Volume/Capacity Ratio

NB = Northbound; SB = Southbound

I-5 = Interstate 5; I-405 = Interstate 405

SR-133 = State Route 133; SR-241 = State Route 241; SR-261 = State Route 261

Long-Range Approved Baseline and Plus Project Traffic Volumes and LOS

Peak-Hour Intersection LOS

Table I presents a summary of the intersection LOS for Long-Range Approved (Baseline and Plus Project) conditions. As this table indicates, all study area intersections are forecast to operate at satisfactory LOS in the Baseline (No Project) condition, except for the following location:

- **Intersection # 486:** SR-133 SB Ramps/Great Park Boulevard (LOS E)

With the addition of the proposed project in the Long-Range Approved condition, all study-area intersections are forecast to continue operating at satisfactory LOS, with the exception of the previously stated study area intersection. However, the intersection v/c ratio increase does not exceed the impact threshold at this location. Therefore, the proposed project can be implemented in a Long-Range Approved condition with no peak-hour LOS impacts at study area intersections.

Roadway Segment Volumes and LOS

The ADT volumes and v/c ratios for Long-Range Approved Baseline (No Project) are illustrated on Figures 10 and 11, respectively. The ADT volumes and v/c ratios for Long-Range Approved Plus Project are illustrated on Figures 12 and 13, respectively.

Based on the ADT v/c performance criteria discussed before, several arterial roadway segments in the study area are forecast to operate deficiently in the Long-Range Approved (Baseline and Plus Project) conditions. However, the ADT v/c ratio increase does not exceed the impact threshold for those arterial roadway segments, except for Jeffrey Road between the I-5 NB Ramps and Roosevelt.

The peak-hour roadway segment analysis was performed for Jeffrey Road between the I-5 NB Ramps and Roosevelt. The resulting midblock peak-hour v/c ratios for this arterial roadway segment under the Long-Range Approved (Baseline and Plus Project) conditions are summarized in Table J. As Table J indicates, this arterial roadway segment is forecast to operate at acceptable LOS during the peak hours. Therefore, the proposed project can be implemented in a Long-Range Approved condition with no LOS impacts on arterial roadway segments within the study area.

LSA

Table I: Long-Range Approved Intersection LOS Summary

ITAM Node No.	Intersection	Jurisdiction	LOS E Acceptable?	Baseline				Plus Project				Peak-Hour Δ ICU or Delay		Significant LOS Impact?

Δ = change

= exceeds City's level of service (LOS) criteria

CMP = Congestion Management Program

Delay is reported in seconds/vehicle.

HCM = Highway Capacity Manual

ICU = Intersection Capacity Utilization

NB = Northbound

SB = Southbound

N/A = Not applicable (unsignalized intersection)

"--" = Not existing in the Long-Range Approved condition.

[1] It is a roundabout.

Δ = change
I-5 = Interstate 5
LOS = level of service
NB = northbound
SB = southbound
v/c = volume-to-capacity ratio

Peak-Hour Freeway/Tollway Ramp LOS

A summary of freeway/tollway ramp LOS for Long-Range Approved (Baseline and Plus Project) is presented in Table K.

Based on the v/c performance criteria discussed above, several freeway/tollway ramps in the study area are forecast to operate deficiently in the Long-Range Approved (Baseline and Plus Project) conditions. However, the v/c ratio increase does not exceed the impact threshold for those ramp locations, except for the I-5 SB on-ramp at Jeffrey Road with the v/c ratio increase of 0.02 in the a.m. peak hour. Therefore, the implementation of the proposed project will result in an LOS impact at the I-5 SB on-ramp at Jeffrey Road.

The conversion of the HOV preferential on-ramp to a second metered mixed-flow lane at the I-5 SB on-ramp at Jeffrey Road will increase the on-ramp capacity and reduce the project's LOS impact. This is also identified as a "partially funded" NITM improvement. As such, the project will participate in the implementation of this proposed mitigation improvement on a fair-share basis to mitigate its impact utilizing the methodology applied in the NITM program for determining fair share. The fair share calculation is based on the project's proportion of the forecasted Long-Range Approved peak-hour volume ([plus project peak-hour volume - baseline peak-hour volume]/plus project peak-hour volume). As shown in Table K, the Long-Range Approved Baseline a.m. peak-hour volume at this ramp is 1,218 and the Long-Range Approved Plus Project a.m. peak-hour volume at this ramp is 1,238, which results in a 1.62 percent fair share contribution.

Peak-Hour Freeway/Tollway Mainline LOS

A summary of freeway/tollway mainline LOS for Long-Range Approved (Baseline and Plus Project) is presented in Table L.

Based on the v/c performance criteria discussed before, several freeway/tollway mainline segments in the study area are forecast to operate deficiently in the Long-Range Approved (Baseline and Plus Project) conditions. However, the v/c ratio increase does not exceed the impact threshold for those mainline locations. Therefore, the proposed project can be implemented in a Long-Range Approved condition with no peak-hour LOS impacts on freeway/tollway mainline segments in the study area.

LSA

Table K: Long-Range Approved Freeway/Tollway Ramp LOS Summary

Interchange	Ramp	Lanes	Peak Hour Capacity	Baseline						Plus Project						V/C Δ		Significant Impact?

= exceeds level of service (LOS) criteria

V/C = Volume/Capacity Ratio

NB = Northbound; SB = Southbound

I-5 = Interstate 5; I-405 = Interstate 405

SR-133 = State Route 133; SR-241 = State Route 241; SR-261 = State Route 261

Buildout Approved Baseline and Plus Project Traffic Volumes and LOS

Peak-Hour Intersection LOS

Table M presents a summary of the intersection LOS for Buildout Approved (Baseline and Plus Project) conditions. As this table indicates, all study area intersections are forecast to operate at satisfactory LOS in the Baseline (No Project) condition, except for the following locations:

- **Intersection # 388:** Ridge Route Drive/Avenida Carlota (LOS F)
- **Intersection # 469:** Jamboree Road/Handy Creek Road (LOS E)
- **Intersection # 470:** SR-261 SB Ramps/Handy Creek Road (LOS F)
- **Intersection # 486:** SR-133 SB Ramps/Great Park Boulevard (LOS E)

With the addition of the proposed project in the Buildout Approved condition, all study-area intersections are forecast to continue operating at satisfactory LOS, with the exception of the previously stated study area intersections. However, the intersection v/c ratio increase does not exceed the impact threshold at those locations. Therefore, the proposed project can be implemented in a Buildout Approved condition with no peak-hour LOS impacts at study area intersections.

Roadway Segment Volumes and LOS

The ADT volumes and v/c ratios for Buildout Approved Baseline (No Project) are illustrated on Figures 14 and 15, respectively. The ADT volumes and v/c ratios for Buildout Approved Plus Project are illustrated on Figures 16 and 17, respectively.

Based on the ADT v/c performance criteria discussed before, several arterial roadway segments in the study area are forecast to operate deficiently in the Buildout Approved (Baseline and Plus Project) conditions. However, the ADT v/c ratio increase does not exceed the impact threshold for those arterial roadway segments, except for the following locations:

- Jeffrey Road between the I-5 NB Ramps and Roosevelt
- Jeffrey Road between Walnut Avenue and Irvine Center Drive

The peak-hour roadway segment analysis was performed for those roadway segments on Jeffrey Road. The resulting midblock peak-hour v/c ratios for those arterial roadway segments on Jeffrey Road under the Buildout Approved (Baseline and Plus Project) conditions are summarized in Table N. As Table N indicates, those arterial roadway segments on Jeffrey Road are forecast to operate at acceptable LOS during the peak hours. Therefore, the proposed project can be implemented in a Buildout Approved condition with no LOS impacts on arterial roadway segments within the study area.

LSA

Table M: Buildout Approved Intersection LOS Summary

ITAM Node No.	Intersection	Jurisdiction	LOS E Acceptable?	Baseline				Plus Project				Peak-Hour Δ		Significant LOS Impact?

Δ = change

= exceeds City's level of service (LOS) criteria

CMP = Congestion Management Program

Delay is reported in seconds/vehicle.

HCM = Highway Capacity Manual

ICU = Intersection Capacity Utilization

NB = Northbound

SB = Southbound

N/A = Not applicable (unsignalized intersection)

[1] It is a roundabout.

Δ = change
I-5 = Interstate 5
LOS = level of service
NB = northbound
SB = southbound
V/C = volume-to-capacity ratio

Peak-Hour Freeway/Tollway Ramp LOS

A summary of freeway/tollway ramp LOS for Buildout Approved (Baseline and Plus Project) is presented in Table O.

Based on the v/c performance criteria discussed before, several freeway/tollway ramps in the study area are forecast to operate deficiently in the Buildout Approved (Baseline and Plus Project) conditions. However, the v/c ratio increase does not exceed the impact threshold for those ramp locations. Therefore, the proposed project can be implemented in a Buildout Approved condition with no peak-hour LOS impacts on freeway/tollway ramps in the study area.

Peak-Hour Freeway/Tollway Mainline LOS

A summary of freeway/tollway mainline LOS for Buildout Approved (Baseline and Plus Project) is presented in Table P.

Based on the v/c performance criteria discussed before, several freeway/tollway mainline segments in the study area are forecast to operate deficiently in the Buildout Approved (Baseline and Plus Project) conditions. However, the v/c ratio increase does not exceed the impact threshold for those mainline locations. Therefore, the proposed project can be implemented in a Buildout Approved condition with no peak-hour LOS impacts on freeway/tollway mainline segments within the study area.

LSA

Table O: Buildout Approved Freeway/Tollway Ramp LOS Summary

Interchange	Ramp	Lanes	Peak Hour Capacity	Baseline						Plus Project						V/C Δ		Significant Impact?

= exceeds level of service (LOS) criteria

V/C = Volume/Capacity Ratio

NB = Northbound; SB = Southbound

I-5 = Interstate 5; I-405 = Interstate 405

SR-133 = State Route 133; SR-241 = State Route 241; SR-261 = State Route 261

Buildout Pending Baseline and Plus Project Traffic Volumes and LOS

Peak-Hour Intersection LOS

Table Q presents a summary of the intersection LOS for Buildout Pending (Baseline and Plus Project) conditions. As this table indicates, all study-area intersections are forecast to operate at satisfactory LOS in the Baseline (No Project) condition, except for the following locations:

- **Intersection # 34:** Red Hill Avenue/Irvine Boulevard (LOS E)
- **Intersection # 291:** Jeffrey Road/Alton Parkway (LOS E)
- **Intersection # 327:** Barranca Parkway/Technology (LOS E)
- **Intersection # 356:** Pacifica/Irvine Center Drive (LOS E)
- **Intersection # 388:** Ridge Route Drive/Avenida Carlota (LOS F)
- **Intersection # 469:** Jamboree Road/Handy Creek Road (LOS E)
- **Intersection # 470:** SR-261 SB Ramps/Handy Creek Road (LOS E)
- **Intersection # 486:** SR-133 SB Ramps/Great Park Boulevard (LOS E)
- **Intersection # 565:** Treble/Marine Way (LOS F)
- **Intersection # 566:** Marine Way/Barranca Parkway (LOS E)

With the addition of the proposed project in the Buildout Pending condition, all study area intersections are forecast to continue operating at satisfactory LOS, with the exception of the previously stated study area intersections. However, the intersection v/c ratio increase does not exceed the impact threshold at those locations. Therefore, the proposed project can be implemented in a Buildout Approved condition with no peak-hour LOS impacts at study area intersections.

Roadway Segment Volumes and LOS

The ADT volumes and v/c ratios for Buildout Pending Baseline (No Project) are illustrated on Figures 18 and 19, respectively. The ADT volumes and v/c ratios for Pending Approved Plus Project are illustrated on Figures 20 and 21, respectively.

Based on the ADT v/c performance criteria discussed before, several arterial roadway segments in the study area are forecast to operate deficiently in the Buildout Pending (Baseline and Plus Project) conditions. However, the ADT v/c ratio increase does not exceed the impact threshold for those arterial roadway segments, except for the following locations:

- Jeffrey Road between the I-5 NB Ramps and Roosevelt
- Jeffrey Road between Walnut Avenue and Irvine Center Drive
- Jeffrey Road between Barranca Parkway and Alton Parkway

LSA

Table Q: Buildout Pending Intersection LOS Summary

ITAM Node No.	Intersection	Jurisdiction	LOS E Acceptable?	Baseline				Plus Project				Peak-Hour Δ		Significant LOS Impact?

The peak-hour roadway segment analysis was performed for those roadway segments on Jeffrey Road. The resulting midblock peak-hour v/c ratios for those arterial roadway segments on Jeffrey Road under the Buildout Pending (Baseline and Plus Project) conditions are summarized in Table R. As Table R indicates, those arterial roadway segments on Jeffrey Road are forecast to operate at acceptable LOS during the peak hours. Therefore, the proposed project can be implemented in a Buildout Pending condition with no LOS impacts on arterial roadway segments within the study area.

Table R: Buildout Pending Arterial Roadway Peak Hour Link Analysis Summary

Roadway Segment	Peak Hour	Direction	Peak-Hour Capacity (Vehicles/Hour)	Baseline			Plus Project			Δ v/c Ratio	Significant LOS Impact?
				Volume	v/c	LOS	Volume	v/c	LOS

Peak-Hour Freeway/Tollway Ramp LOS

A summary of freeway/tollway ramp LOS for Buildout Pending (Baseline and Plus Project) is presented in Table S.

Based on the v/c performance criteria discussed above, several freeway/tollway ramps in the study area are forecast to operate deficiently in the Buildout Pending (Baseline and Plus Project) conditions. However, the v/c ratio increase does not exceed the impact threshold for those ramp locations. Therefore, the proposed project can be implemented in a Buildout Pending condition with no peak-hour LOS impacts on freeway/tollway ramps in the study area.

LSA

Table S: Buildout Pending Freeway/Tollway Ramp LOS Summary

Interchange	Ramp	Lanes	Peak Hour Capacity	Baseline						Plus Project						V/C Δ		Significant Impact?

= exceeds level of service (LOS) criteria

V/C = Volume/Capacity Ratio

NB = Northbound; SB = Southbound

I-5 = Interstate 5; I-405 = Interstate 405

SR-133 = State Route 133; SR-241 = State Route 241; SR-261 = State Route 261

The conversion of the HOV preferential on-ramp to a second metered mixed-flow lane at the I-5 SB on-ramp at Jeffrey Road will increase the on-ramp capacity and reduce the project's LOS impact. This is also identified as a "partially funded" NITM improvement. As such, the project will participate in the implementation of this proposed mitigation improvement on a fair-share basis to mitigate its impact utilizing the methodology applied in the NITM program for determining fair share. The fair share calculation is based on the project's proportion of the forecasted Buildout Pending peak-hour volume ([plus project peak-hour volume - baseline peak-hour volume]/plus project peak-hour volume). As shown in Table S, the Buildout Pending Baseline p.m. peak-hour volume at this ramp is 1,428, and the Buildout Pending Plus Project p.m. peak-hour volume at this ramp is 1,443, which results in a 1.04 percent fair share contribution.

Peak-Hour Freeway/Tollway Mainline LOS

A summary of freeway/tollway mainline LOS for Buildout Pending (Baseline and Plus Project) is presented in Table T.

Based on the v/c performance criteria discussed before, several freeway/tollway mainline segments in the study area are forecast to operate deficiently in the Buildout Pending (Baseline and Plus Project) conditions. However, the v/c ratio increase does not exceed the impact threshold for those mainline locations. Therefore, the proposed project can be implemented in a Buildout Pending condition with no peak-hour LOS impacts on freeway/tollway mainline segments within the study area.

SPECIAL ISSUES

Access to the project site will be provided via three full-access driveways (A, B, and C Streets) on Jeffrey Road and an RIRO driveway (E Street) on Portola Parkway. Two scenarios have been evaluated for the access analysis of this project:

- **Existing (Baseline and Plus Project) Scenario**: Under this scenario, the extension of Jeffrey Road towards SR-241, based on the City's Master Plan of Arterial Highways (MPAH), does not exist. As recently constructed, Jeffrey Road (north of Portola Parkway) is a four-lane Primary roadway, and it terminates near C Street (approximately 3,100 feet north of Portola Parkway). This segment currently provides access to existing uses, including electrical substations on the west side of Jeffrey Road and the Irvine Ranch Conservancy Native Seed Farm and other small businesses on the east side of Jeffrey Road. The cross-section measurement for Jeffrey Road north of Portola Parkway to C Street is approximately 33 feet in each direction, which is wide enough to provide two through lanes with on-street bike lanes.

  With the development of the proposed project, the segment of Jeffrey Road (north of Portola Parkway) will allow traffic to access the project site via three driveways on Jeffrey Road. As confirmed with City staff, the roadway segment of Jeffrey Road between Portola Parkway and C Street would continue to be a four-lane facility. At each project driveway (A, B, and C Streets) on Jeffrey Road, an NB de-facto right-turn lane would be provided. In addition, a 150-foot dedicated SB left-turn lane with a 90-foot taper would be provided at A and B Streets. Figure 22 shows the roadway configuration of Jeffrey Road between Portola Parkway and C Street in the Existing Plus Project condition.

Irvine Gateway Village

Jeffrey Road Configuration in Existing Plus Project Condition

P:\2023\20231340 - Irvine Gateway\GIS\Conceptual_Striping.dwg (4/4/2025)

- **Buildout Approved (Baseline and Plus Project) Scenario**: Under this scenario, the extension of Jeffrey Road towards SR-241 and further north to Santiago Canyon Road is assumed to be built. Jeffrey Road, north of Portola Parkway, is classified as a Primary Highway in the City's *General Plan*. The cross-section measurement for Jeffrey Road north of Portola Parkway would be approximately 33 feet in each direction, which is wide enough to provide two through lanes with on-street bike lanes and de-facto right-turn lanes at the project driveways. In addition, for purposes of this Access Analysis, a 150-foot dedicated SB left-turn lane with a 90-foot taper was assumed to be provided at each driveway on Jeffrey Road. Figure 23 shows the roadway configuration of Jeffrey Road between Portola Parkway and C Street in the Buildout Approved Plus Project condition.

Access Analysis (Existing Baseline and Plus Project Scenario)

All neighborhoods within the project are expected to have access to Jeffrey Road and Portola Parkway via all four project driveways, including A, B, and C Streets from Jeffrey Road and E Street from Portola Parkway. The project driveways that will serve the adjacent parcels, as shown on Figure 2, are listed below:

- A Street is expected to provide access to Parcel Areas 1a and 1b, and a portion of Parcel Area 1c.
- B Street is expected to provide access to Parcel Area 3a and portions of Parcel Areas 1c, 3b, and 3c.
- C Street is expected to provide access to Parcel Area 5 (South Park), and portions of Parcel Areas 3b, 3c, and 3d. C Street will also provide access to existing uses, including Irvine Ranch Conservancy Native Seed Farm, east of the project site.
- E Street is expected to provide access to Parcel Areas 2a, 2b, and 2c.

The total project trips were proportionally assigned to each project driveway based on the estimated parcel area that each driveway could serve, as identified above, and the regional trip distribution from the ITAM select zone outputs.

The evaluation of the project driveways and the adjacent intersection is based on the City's TDP criteria for Existing (Baseline and Plus Project) conditions. Existing traffic counts at the study area intersections (provided in Appendix D) were obtained from the City and used to establish Baseline (No Project) conditions for purposes of the access analysis. For the intersections with 2-day counts, the average of the 2-day counts was used. As previously mentioned, the short roadway segment of Jeffrey Road, north of Portola Parkway, currently provides access to the Irvine Ranch Conservancy Native Seed Farm and other small businesses. For purposes of this access analysis, the existing inbound (46 a.m. and 16 p.m. peak-hour vehicles) and outbound (29 a.m. and 55 p.m. peak-hour vehicles) traffic volume identified from the existing traffic counts has been allocated to C Street in the Existing Baseline condition. Volumes for the proposed project were then added to the Existing traffic counts to represent Existing Plus Project conditions. The Existing Baseline (No Project), Project Trips Distribution (Existing AM), Project Trips Distribution (Existing PM), Project Trips Assignment (Existing), and Existing Plus Project peak-hour traffic volumes are illustrated on Figures 24, 25, 26, 27, and 28, respectively.

Access Analysis

Existing Plus Project Peak-Hour Volumes (No Jeffrey Extension)

P:\2023\20231340 - Irvine Gateway\xls\Fig X - Existing WP.xlsx (12/24/2024)

This analysis has been conducted consistent with the approved Scope of Work and the TDPs. Applicable design criteria for the proposed project include TDP-1 (Turn Lane Pocket Lengths), TDP-3 (Left-Turn In/Out Access), TDP-4 (Right-Turn Lanes at Uncontrolled Driveways), TDP-10 (Distances Between Driveways), TDP-12 (Traffic Signal Warrant), and TDP-14 (Driveway Lengths).

TDP-1: Turn Lane Pocket Lengths

The length of left-turn pockets at signalized intersections is based on several parameters, including traffic control, turn volume, and cycle length. The purpose of the turn-pocket length is to allow the turning vehicle to exit the through movement and decelerate into the turn pocket without affecting the through movement. The minimum single-turn pocket length for Major, Primary, and Secondary Highways (i.e., Jeffrey Road and Portola Parkway) is 150 feet. A zero percent truck mix has been assumed for this analysis. This assumption is based on the nature of the project being residential use, which typically does not generate truck traffic.

Jeffrey Road/Portola Parkway (Southbound Jeffrey Road). The dual SB left-turn lanes at the signalized intersection of Jeffrey Road/Portola Parkway are each approximately 240 feet (480 feet total) with a 160-foot transition. The Existing left-turn demand at this location is 6 vehicles during the a.m. peak hour and 1 vehicle during the p.m. peak hour. Based on TDP-1 criteria, the dual SB left-turn lanes meet the 5 feet required to accommodate the existing 6 a.m. peak-hour vehicles. The Existing Plus Project left-turn demand at this location is 96 a.m. and 57 p.m. peak-hour vehicles (i.e., the addition of 90 a.m. and 56 p.m. peak-hour vehicles), which would require a 120-foot left-turn lane. As in the Existing No Project condition, the 480-foot SB left-turn pocket length will continue to meet the TDP-1 criteria.

Jeffrey Road/Portola Parkway (Eastbound Portola Parkway). The dual eastbound (EB) left-turn lanes at the signalized intersection of Jeffrey Road/Portola Parkway are each approximately 385 feet (770 feet total) with a 120-foot transition. The Existing left-turn demand at this location is 20 vehicles during the a.m. peak hour and 6 vehicles during the p.m. peak hour. Based on TDP-1 criteria, the dual EB left-turn lanes meet the 25 feet required to accommodate the existing 20 a.m. peak-hour vehicles. The Existing Plus Project left-turn demand at this location is 66 a.m. and 129 p.m. peak-hour vehicles (i.e., the addition of 46 a.m. and 123 p.m. peak-hour vehicles), which would require a 160-foot left-turn lane. As in the Existing No Project condition, the 770-foot EB left-turn pocket length will continue to meet the TDP-1 criteria.

TDP-3: Left-Turn In/Out Access

TDP-3 provides procedures to determine whether left-turn in only or left-turn in/out access will be considered along Major, Primary, Secondary, and Commuter Streets. This TDP is based on the volume of vehicles entering and/or exiting a driveway in relationship to the conflicting volumes along the highway.

Figure 3.1 (Left-Turn Access Design Procedures) in the City's TDP guidelines depicts the calculations for conflicting volumes. Figure 3.2 (Left-Turn Access Criteria) in the City's TDP guidelines presents a graph in which the left-turn volumes are compared to the conflicting volumes. Left-turn in/out access is considered acceptable when the point representing the left-turn volume and the conflicting volume lies below the line. Access is not recommended when this point is above the line.

Table U provides a summary of the TDP-3 analysis of the three unsignalized project driveways on Jeffrey Road under Existing Plus Project conditions.

Jeffrey Road/A Street. Under Existing Plus Project conditions, the SB Jeffrey Road left-turn volumes into the project site via this unsignalized driveway are minimal (if any) since Jeffrey Road terminates near C Street. The conflicting volume for left-turn in access would be 194 a.m. and 526 p.m. peak-hour vehicles for the Existing Plus Project condition. Based on TDP-3, the volumes are below the point representing the left-turn in volume and the conflicting volumes; therefore, the TDP-3 criteria for left-turn in access are satisfied for this project driveway.

Under Existing Plus Project conditions, the left-turn volumes out of the project site via this unsignalized driveway are 286 a.m. and 179 p.m. peak-hour vehicles. The conflicting volumes for left-turn out access would be 403 a.m. and 578 p.m. peak-hour vehicles for the Existing Plus Project condition. Based on TDP-3, the volumes are above the point representing the left-turn out volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn out access are not satisfied for this project driveway.

The intersection geometry for Jeffrey Road/A Street in the Existing Plus Project condition is shown on Figure 22. LSA utilized the HCM methodology and Synchro software to evaluate this project driveway, and a stop control was considered. With a consideration of one stop sign installed on A Street (one-way stop controlled), the HCM results (provided in Appendix E) show that the a.m. and p.m. peak-hour LOS at this location are satisfactory LOS B for the Existing Plus Project condition. Therefore, even though left-turn out access at A Street does not meet the TDP-3 criteria, no operational deficiencies or impacts are expected at this unsignalized driveway and minimal adverse effects are expected to adjacent public roadways.

Jeffrey Road/B Street. Under Existing Plus Project conditions, the SB Jeffrey Road left-turn volumes into the project site via this unsignalized driveway are minimal (if any) since Jeffrey Road terminates near C Street. The conflicting volumes for left-turn in access would be 115 a.m. and 245 p.m. peak-hour vehicles for the Existing Plus Project condition. Based on TDP-3, the volumes are below the point representing the left-turn in volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn in access are satisfied for this project driveway.

Under Existing Plus Project conditions, the left-turn volumes out of the project site via this unsignalized driveway are 118 a.m. and 74 p.m. peak-hour vehicles. The conflicting volumes for left-turn out access would be 227 a.m. and 302 p.m. peak-hour vehicles for the Existing Plus Project condition. Based on TDP-3, the volumes are below the point representing the left-turn out volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn out access are satisfied for this project driveway.

Jeffrey Road/C Street. Under Existing Plus Project conditions, the SB Jeffrey Road left-turn volumes into the project site via this unsignalized driveway are minimal (if any) since Jeffrey Road terminates near C Street. The conflicting volumes for left-turn in access would be 78 a.m. and 122 p.m. peak-hour vehicles for the Existing Plus Project condition. Based on TDP-3, the volumes are below the point representing the left-turn in volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn in access are satisfied for this project driveway.

LSA

Table U: TDP-3 Analysis Summary (Existing Plus Project)

Turn Movement	Jeffrey Road/A Street		Jeffrey Road/B Street		Jeffrey Road/C Street	
	AM	PM	AM	PM	AM	PM

Source: Compiled by LSA (2024).

V_C = conflicting volume

[1] V_C = NBT + NBR

[2] V_C = 1/2 NBR + NBT + SBL + SBT

LTV-I = left-turn volume in

LTV-O = left-turn volume out

Under Existing Plus Project conditions, the left-turn volumes out of the project site via this unsignalized driveway are 130 a.m. and 118 p.m. peak-hour vehicles. The conflicting volumes for left-turn out access would be 39 a.m. and 61 p.m. peak-hour vehicles for the Existing Plus Project condition. Based on TDP-3, the volumes are below the point representing the left-turn out volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn out access are satisfied for this project driveway.

TDP-4: Right-Turn Lanes at Uncontrolled Driveways

TDP-4 states that right-turn lanes at unsignalized driveways along Primary Highways (i.e., Portola Parkway east of Jeffrey Road and Jeffrey Road north of Portola Parkway) are required for a peak hourly right-turn volume of 100 vehicles.

The City currently permits a de-facto right-turn lane provided the curb lane is a minimum of 19 feet or where there are existing on-street bike lanes provided, the curb lane width is at least 12 feet wide plus a 7-foot bike lane. Jeffrey Road north of Portola Parkway has been recently constructed with a 12-foot outside lane and an 8-foot bike lane, which provides for a de-facto right-turn lane at A, B, and C Streets.

Jeffrey Road/A Street. A Street is an unsignalized full-access driveway on Jeffrey Road. As shown on Figure 28, NB right-turn volumes on Jeffrey Road at A Street are 79 a.m. and 281 p.m. peak-hour vehicles under Existing Plus Project conditions. As such, a dedicated right-turn lane is required at this project driveway. As previously stated, a NB de-facto right-turn lane is currently provided at this location. This additional roadway capacity will adequately accommodate the queueing that may be expected from these NB right turns on Jeffrey Road, resulting in minimal adverse effects to the operation of Jeffrey Road. Therefore, the proposed condition meets the intent of TDP-4 for the Existing Plus Project condition.

Jeffrey Road/B Street. B Street is an unsignalized full-access driveway on Jeffrey Road. As shown on Figure 28, NB right-turn volumes on Jeffrey Road at B Street are 37 a.m. and 123 p.m. peak-hour vehicles under Existing Plus Project conditions. As such, a dedicated right-turn lane is required at this project driveway. As previously stated, a NB de-facto right-turn lane is currently provided at this location. This additional roadway capacity will adequately accommodate the queueing that may be expected from these NB right turns on Jeffrey Road, resulting in minimal adverse effects to the operation of Jeffrey Road. Therefore, the proposed condition meets the intent of TDP-4 for the Existing Plus Project condition.

Jeffrey Road/C Street. C Street is an unsignalized full-access driveway on Jeffrey Road. As shown on Figure 28, NB right-turn volumes on Jeffrey Road at C Street are 78 a.m. and 122 p.m. peak-hour vehicles under Existing Plus Project conditions. As such, a dedicated right-turn lane is required at this project driveway. As previously stated, a NB de-facto right-turn lane is provided at this location. This additional roadway capacity will adequately accommodate the queueing that may be expected from these NB right turns on Jeffrey Road, resulting in minimal adverse effects to the operation of Jeffrey Road. Therefore, the proposed condition meets the intent of TDP-4 for the Existing Plus Project condition.

E Street/Portola Parkway. E Street is an unsignalized RIRO driveway on Portola Parkway. As shown on Figure 28, westbound (WB) right-turn volumes on Portola Parkway at E Street are 30 a.m. and 76 p.m. peak-hour vehicles under Existing Plus Project conditions. As such, a dedicated right-turn lane is not required at this project driveway. It should be noted, however, that the updated site plan provided by the developer will include a 300 ft WB dedicated right-turn lane with a 145 ft taper at E Street on Portola Parkway to minimize the potential conflicts between through traffic and project turn volumes.

TDP-10: Distance Between Driveways and Intersections

TDP-10 states that the recommended minimum spacing between a driveway and an intersection, or two driveways is 230 feet for a Primary Highway (i.e., Portola Parkway east of Jeffrey Road and Jeffrey Road north of Portola Parkway). Distances between driveways should be measured between the centerlines of each driveway. The distance between an intersection and a driveway should be measured from the curb face of the street to the curb face of the driveway.

Figure 29 illustrates the driveway distances (and required driveway lengths) in the vicinity of the project site.

Jeffrey Road/A Street. A Street on Jeffrey Road is approximately 860 feet north of the signalized intersection of Jeffrey Road and Portola Parkway. This driveway is approximately 1,120 feet south of a driveway on the same side of the street and approximately 520 feet north of a driveway on the opposite side of the street. As such, TDP-10 is met for this project driveway.

Jeffrey Road/B Street. B Street on Jeffrey Road is approximately 750 feet south and 1,120 feet north of driveways on the same side of the street. As such, TDP-10 is met for this project driveway.

Jeffrey Road/C Street. C Street on Jeffrey Road is approximately 750 feet north of a driveway on the same side of the street. As such, TDP-10 is met for this project driveway.

E Street/Portola Parkway. E Street (the RIRO driveway) is located on Portola Parkway with a raised median and this driveway does not have adjacent driveways on the same or opposite side of the street. E Street is approximately 1,030 feet east of the signalized intersection of Jeffrey Road/Portola Parkway and approximately 870 feet west of the signalized intersection of Bee Canyon Access Road and Portola Parkway. As such, TDP-10 is met for this project driveway.

TDP-12: Traffic Signal Warrant

TDP-12 provides guidance to determine whether installation of a traffic signal would be justified at a particular location. The peak-hour signal warrant is generally intended for use at locations where traffic conditions are such that for a minimum of 1 hour of an average day, the minor street (i.e., project driveway) suffers undue delay when entering or crossing the major street (i.e., Jeffrey Road).

A peak-hour signal warrant (Warrant 3) analysis per TDP-12 criteria has been prepared to determine if the installation of a traffic signal would be warranted at three driveways (A/B/C Street) along Jeffrey Road. The thresholds shown on Figure 4C-4 of the California Manual on Uniform Traffic Control Devices (CA MUTCD) have been compared to the traffic volumes.

Access Analysis

Driveway Distances and Required Driveway Lengths

Traffic signals are not warranted at A, B, and C Streets under the Existing Plus Project conditions, per TDP-12 (Warrant 3 - Peak Hour). Table V summarizes the signal warrant analysis.

TDP-14: Driveway Lengths

TDP-14 provides guidance regarding a sufficient driveway length to allow vehicles "to enter the parking area without causing subsequent vehicles to back out on the City street system" (City of Irvine 2007). The measurement of sufficient length is based on the distance from the back of the sidewalk or stop bar to the first intersecting parking space or traffic control measure (i.e., gate/ internal drive aisle) on site.

The minimum unsignalized driveway length should be 25 feet and should increase at a rate of 1 feet of storage per peak-hour vehicle (in 25-foot increments). Figure 29 illustrates the minimum driveway lengths required to accommodate the inbound peak-hour traffic volume at each project driveway in accordance with TDP-14 criteria.

At the time this traffic study was prepared, a detailed project site plan had not been finalized. However, the project applicant is aware that the minimum requirements for driveway lengths per TDP-14 as described below should be incorporated into the project design.

Jeffrey Road/A Street. This is an unsignalized driveway proposed by this project on Jeffrey Road. Application of the minimum unsignalized driveway length criteria contained in TDP-14 to the Existing Plus Project peak-hour inbound traffic volumes shown on Figure 28 results in a recommended driveway length of 300 feet for the 79 a.m. or 281 p.m. peak-hour inbound vehicles entering A Street on Jeffrey Road.

Jeffrey Road/B Street. This is an unsignalized driveway proposed by this project on Jeffrey Road. Application of the minimum unsignalized driveway length criteria contained in TDP-14 to the Existing Plus Project peak-hour inbound traffic volumes shown on Figure 28 results in a recommended driveway length of 125 feet for the 37 a.m. or 123 p.m. peak-hour inbound vehicles entering B Street on Jeffrey Road.

Jeffrey Road/C Street. This is an unsignalized driveway proposed by this project on Jeffrey Road. Application of the minimum unsignalized driveway length criteria contained in TDP-14 to the Existing Plus Project peak-hour inbound traffic volumes shown on Figure 28 results in a recommended driveway length of 125 feet for the 78 a.m. or 122 p.m. peak-hour inbound vehicles entering C Street on Jeffrey Road.

E Street/Portola Parkway. This is an unsignalized RIRO driveway proposed by this project on Portola Parkway. Application of the minimum unsignalized driveway length criteria contained in TDP-14 to the Existing Plus Project peak-hour inbound traffic volumes shown on Figure 28 results in a recommended driveway length of 100 feet for the 30 a.m. or 76 p.m. peak-hour inbound vehicles entering E Street on Portola Parkway.

[1] The Major Street (Jeffrey Road) has two-lane approaches.
The Minor Street (A Street) has a one-lane approach.

[2] The Major Street (Jeffrey Road) has one-lane approaches.
The Minor Street (B/C Street) has a one-lane approach.

[3] 75 vehicles per hour applies as the lower threshold volume for a minor-street approach with one lane

Access Analysis (Buildout Approved Baseline and Plus Project Scenario)

As previously mentioned, the extension of Jeffrey Road towards SR-241 and further north to Santiago Canyon Road is assumed to be built under the Buildout Approved (Baseline and Plus Project) conditions. Jeffrey Road, north of Portola Parkway, is classified as a Primary Highway in the *General Plan*. The cross-section measurement for Jeffrey Road near A Street would be approximately 33 feet in each direction, which is wide enough to provide two through lanes and on-street bike lanes with a de-facto right-turn lane at the project driveways.

The ITAM select zone outputs were used to identify the regional trip distribution for the project trips, and no adjustments were made to the regional trip distribution. Consistent with the Existing scenario, the total inbound and outbound project trips were split at each project driveway based on an approximation of the parcel area and units that each driveway would serve.

Traffic volumes at the intersection of Jeffrey Road/Portola Parkway (provided in Appendix B) from ITAM model outputs for the Buildout Approved Baseline (No Project) scenario were used to establish Baseline conditions for purposes of the access analysis. In addition, the existing inbound (46 a.m. and 16 p.m. peak-hour vehicles) and outbound (29 a.m. and 55 p.m. peak-hour vehicles) traffic volumes from the existing traffic counts north of Portola Parkway have been assigned to C Street in the Buildout Approved Baseline condition. Volumes for the proposed project were then added to the Buildout Approved Baseline to represent Buildout Approved Plus Project conditions. The Buildout Approved Baseline (No Project), Project Trips Distribution (Buildout Approved AM), Project Trips Distribution (Buildout Approved PM), Project Trips Assignment (Buildout Approved), and Buildout Approved Plus Project peak-hour traffic volumes are illustrated on Figures 30, 31, 32, 33, and 34, respectively.

Consistent with the TDPs, applicable design criteria for the proposed project, including TDP-1 (Turn Lane Pocket Lengths), TDP-3 (Left-Turn In/Out Access), TDP-4 (Right-Turn Lanes at Uncontrolled Driveways), TDP-10 (Distances between Driveways), TDP-12 (Traffic Signal Warrant), and TDP-14 (Driveway Lengths), were analyzed under the Buildout Approved (Baseline and Plus Project) conditions.

TDP-1: Turn Lane Pocket Lengths

Jeffrey Road/Portola Parkway (Southbound Jeffrey Road). The dual SB left-turn lanes at the signalized intersection of Jeffrey Road/Portola Parkway are each approximately 240 feet (480 feet total) with a 160-foot transition. The Buildout Approved No Project left-turn demand at this location is 251 vehicles during the a.m. peak hour and 30 vehicles during the p.m. peak hour. Based on TDP-1 criteria, the dual SB left-turn lanes meet the 315 feet required to accommodate the 251 a.m. peak-hour vehicles. The Buildout Approved Plus Project left-turn demand at this location is 341 a.m. and 86 p.m. peak-hour vehicles (i.e., the addition of 90 a.m. and 56 p.m. peak-hour vehicles), which would require a 425-foot left-turn lane. The 480-foot SB left-turn pocket length will continue to meet the TDP-1 criteria in both the Existing and Buildout Approved conditions.

Buildout Approved Plus Project Peak-Hour Volumes (With Jeffrey Extension)

P:\2023\20231340 - Irvine Gateway\xls\Fig X - BO WP.xlsx (12/24/2024)

Jeffrey Road/Portola Parkway (Eastbound Portola Parkway). The dual EB left-turn lanes at the signalized intersection of Jeffrey Road/Portola Parkway are each approximately 385 feet (770 feet total) with a 120-foot transition. The Buildout Approved No Project left-turn demand at this location is 120 vehicles during the a.m. peak hour and 229 vehicles during the p.m. peak hour. Based on TDP-1 criteria, the dual EB left-turn lanes meet the 285 feet required to accommodate the 229 p.m. peak-hour vehicles. The Buildout Approved Plus Project left-turn demand at this location is 164 a.m. and 346 p.m. peak-hour vehicles (i.e., the addition of 44 a.m. and 117 p.m. peak-hour vehicles), which would require a 430-foot left-turn lane. The 770-foot EB left-turn pocket length will continue to meet the TDP-1 criteria in both the Existing and Buildout Approved conditions.

Jeffrey Road/A Street (Southbound). A 150-foot dedicated SB left-turn lane with a 90-foot taper was assumed to be built at A Street in the Buildout Approved Plus Project condition. The Buildout Approved Plus Project left-turn demand at this location is minimal, expected to be 2 a.m. and 6 p.m. peak-hour vehicles; therefore, a minimum 150-foot SB left-turn pocket would meet the TDP-1 criteria in the Buildout Approved Plus Project condition.

Jeffrey Road/B Street (Southbound). A 150-foot dedicated SB left-turn lane with a 90-foot taper was assumed to be built at B Street in the Buildout Approved Plus Project condition. The Buildout Approved Plus Project left-turn demand at this location is minimal, expected to be 1 a.m. and 3 p.m. peak-hour vehicles; therefore, a minimum 150-foot SB left-turn pocket would meet the TDP-1 criteria in the Buildout Approved Plus Project condition.

Jeffrey Road/C Street (Southbound). A 150-foot dedicated SB left-turn lane with a 90-foot taper was assumed to be built at C Street in the Buildout Approved Plus Project condition. The Buildout Approved Plus Project left-turn demand at this location is minimal, expected to be 1 a.m. and 3 p.m. peak-hour vehicles; therefore, a minimum 150-foot SB left-turn pocket would meet the TDP-1 criteria in the Buildout Approved Plus Project condition.

TDP-3: Left-Turn In/Out Access

Table W provides a summary of the TDP-3 analysis of the three unsignalized project driveways on Jeffrey Road under Buildout Approved Plus Project conditions.

Jeffrey Road/A Street. Under Buildout Approved Plus Project conditions, the SB Jeffrey Road left-turn volumes into the project site via this unsignalized driveway are 2 a.m. and 6 p.m. peak-hour vehicles. The conflicting volumes for left-turn in access would be 350 a.m. and 1,088 p.m. peak-hour vehicles for the Buildout Approved Plus Project condition. Based on TDP-3, the volumes are below the point representing the left-turn in volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn in access are satisfied for this project driveway.

Under Buildout Approved Plus Project conditions, the left-turn volumes out of the project site via this unsignalized driveway are 280 a.m. and 175 p.m. peak-hour vehicles. The conflicting volumes for left-turn out access would be 1,391 a.m. and 1,217 p.m. peak-hour vehicles for the Buildout Approved Plus Project condition. Based on TDP-3, the volumes are above the point representing the left-turn out volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn out access are not satisfied for this project driveway.

LTV-O = left-turn volume out

The intersection geometry for Jeffrey Road/A Street in the Buildout Approved Plus Project condition is shown on Figure 23. LSA utilized HCM methodology and Synchro software to evaluate this project driveway, and a stop control was considered. With a consideration of one stop sign installed on A Street (one-way stop controlled), the HCM results (provided in Appendix E) show that the a.m. and p.m. peak-hour LOS at this location are unsatisfactory LOS F in the Buildout Approved Plus Project condition. With consideration of stop signs installed on both Jeffrey Road (north and south) and A Street (all-way stop controlled), the HCM results (provided in Appendix E) show that the a.m. peak-hour LOS at this location is unsatisfactory LOS E, and the p.m. peak-hour LOS at this location is satisfactory LOS C in the Buildout Approved Plus Project condition.

Since an operational deficiency is expected at this unsignalized driveway, a traffic signal is recommended to provide safe and efficient operation at this location in the Buildout condition. Per TDP-12 (Warrant 3 – Peak Hour), a signal warrant analysis was conducted at this location in the Buildout Approved Plus Project condition. The analysis results, provided later in Table X of this traffic study, indicate that a traffic signal is warranted at this location under the Buildout Approved Plus Project condition. No operational deficiency or impact is expected at this driveway once the traffic signal is installed in the Buildout Approved Plus Project condition when and/or if Jeffrey Road is extended to SR-241.

Jeffrey Road/B Street. Under Buildout Approved Plus Project conditions, the SB Jeffrey Road left-turn volumes into the project site via this unsignalized driveway are 1 a.m. and 3 p.m. peak-hour vehicles. The conflicting volumes for left-turn in access would be 279 a.m. and 817 p.m. peak-hour vehicles for the Buildout Approved Plus Project condition. Based on TDP-3, the volumes are below the point representing the left-turn in volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn in access are satisfied for this project driveway.

Under Buildout Approved Plus Project conditions, the left-turn volumes out of the project site via this unsignalized driveway are 115 a.m. and 72 p.m. peak-hour vehicles. The conflicting volumes for left-turn out access would be 1,226 a.m. and 954 p.m. peak-hour vehicles for the Buildout Approved Plus Project condition. Based on TDP-3, the volumes are above the point representing the left-turn out volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn out access are not satisfied for this project driveway.

The intersection geometry for Jeffrey Road/B Street in the Buildout Approved Plus Project condition is shown on Figure 23. LSA utilized the HCM methodology and Synchro software to evaluate this project driveway and a stop control was considered. With consideration of one stop sign installed on B Street (one-way stop controlled), the HCM results (provided in Appendix E) show that the a.m. and p.m. peak-hour LOS at this location are satisfactory LOS C in the Buildout Approved Plus Project condition. Therefore, even though left-turn out access at B Street does not meet the TDP-3 criteria, no operational deficiencies are expected at this unsignalized driveway or adjacent public roadways, and the intent of TDP-3 is met.

Jeffrey Road/C Street. Under Buildout Approved Plus Project conditions, the SB Jeffrey Road left-turn volumes into the project site via this unsignalized driveway are 1 a.m. and 3 p.m. peak-hour vehicles. The conflicting volumes for left-turn in access would be 246 a.m. and 699 p.m. peak-hour vehicles for the Buildout Approved Plus Project condition. Based on TDP-3, the volumes are below

the point representing the left-turn in volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn in access are satisfied for this project driveway.

Under Buildout Approved Plus Project conditions, the left-turn volumes out of the project site via this unsignalized driveway are 127 a.m. and 116 p.m. peak-hour vehicles. The conflicting volumes for left-turn out access would be 1,047 a.m. and 724 p.m. peak-hour vehicles for the Buildout Approved Plus Project condition. Based on TDP-3, the volumes are above the point representing the left-turn out volume and the conflicting volumes. Therefore, the TDP-3 criteria for left-turn out access are not satisfied for this project driveway.

The intersection geometry for Jeffrey Road/C Street in the Buildout Approved Plus Project condition is shown on Figure 23. LSA utilized HCM methodology and Synchro software to evaluate this project driveway, and a stop control was considered. With a consideration of one stop sign installed on C Street (one-way stop controlled), the HCM results (provided in Appendix E) show that the a.m. and p.m. peak-hour LOS at this location are satisfactory LOS C in the Buildout Approved Plus Project condition. Therefore, even though left-turn out access at C Street does not meet the TDP-3 criteria, no operational deficiencies are expected at this unsignalized driveway or adjacent public roadways, and the intent of TDP-3 is met.

TDP-4: Right-Turn Lanes at Uncontrolled Driveways

Jeffrey Road/A Street. As described in TDP-3, above, and later in the TDP-12 analysis, the intersection of Jeffrey Road/A Street is recommended as a signalized intersection. As shown on Figure 34, NB right-turn volumes on Jeffrey Road at A Street are 77 a.m. and 275 p.m. peak-hour vehicles under Buildout Approved Plus Project conditions. A de-facto right-turn lane would be provided at this location, along with signalization of the intersection in the Buildout condition. This signalized location is not subject to TDP-4 criteria.

Jeffrey Road/B Street. B Street is an unsignalized full-access driveway on Jeffrey Road. As shown on Figure 34, NB right-turn volumes on Jeffrey Road at B Street are 36 a.m. and 120 p.m. peak-hour vehicles under Buildout Approved Plus Project conditions. Jeffrey Road north of Portola Parkway is classified as a Primary facility. Expected project traffic volumes are more than the 100 vph, the trigger for recommendation of a right-turn lane for Primary Highways per TDP-4; therefore, a dedicated right-turn lane is required at this project driveway. As previously stated, a de-facto right-turn lane will be provided at this location. This additional roadway capacity will adequately accommodate the queueing that may be expected from these NB right turns on Jeffrey Road, resulting in minimal adverse effects to the operation of Jeffrey Road. Therefore, the proposed condition meets the intent of TDP-4 for the Buildout Approved Plus Project condition.

Jeffrey Road/C Street. C Street is an unsignalized full-access driveway on Jeffrey Road. As shown on Figure 34, NB right-turn volumes on Jeffrey Road at C Street are 77 a.m. and 119 p.m. peak-hour vehicles under Buildout Approved Plus Project conditions. Jeffrey Road north of Portola Parkway is classified as a Primary facility. Expected project traffic volumes are more than the 100 vph, the trigger for recommendation of a right-turn lane for Primary Highways per TDP-4; therefore, a dedicated right-turn lane is required at this project driveway. As previously stated, a de-facto right-turn lane will be provided at this location. This additional roadway capacity will adequately

accommodate the queueing that may be expected from these NB right turns on Jeffrey Road, resulting in minimal adverse effects to the operation of Jeffrey Road. Therefore, the proposed condition meets the intent of TDP-4 for the Buildout Approved Plus Project condition.

E Street/Portola Parkway. E Street is an unsignalized RIRO driveway on Portola Parkway. As shown on Figure 34, WB right-turn volumes on Portola Parkway at E Street are 30 a.m. and 76 p.m. peak-hour vehicles under Buildout Approved Plus Project conditions. Portola Parkway east of Jeffrey Road is a Primary facility. Expected project traffic volumes are less than the 100 vph, the trigger for recommendation of a right-turn lane for Primary Highways per TDP-4; therefore, a dedicated right-turn lane is not required at this project driveway. It should be noted, however, that the updated site plan provided by the developer will include a 300 ft WB dedicated right-turn lane with a 145 ft taper at E Street on Portola Parkway to minimize the potential conflicts between through traffic and project turn volumes.

TDP-10: Distance Between Driveways and Intersections

Figure 29 illustrates the driveway distances (and required driveway lengths) in the vicinity of the project site.

Jeffrey Road/A Street. A Street on Jeffrey Road is approximately 860 feet north of the signalized intersection of Jeffrey Road and Portola Parkway. This driveway is approximately 1,120 feet south of a driveway on the same side of the street and approximately 520 feet north of a driveway on the opposite side of the street. As such, TDP-10 is met for this project driveway.

Jeffrey Road/B Street. B Street on Jeffrey Road is approximately 750 feet south and 1,120 feet north of driveways on the same side of the street. As such, TDP-10 is met for this project driveway.

Jeffrey Road/C Street. C Street on Jeffrey Road is approximately 750 feet north of a driveway on the same side of the street. As such, TDP-10 is met for this project driveway.

E Street/Portola Parkway. E Street (the RIRO driveway) is located on Portola Parkway with a raised median and this driveway does not have adjacent driveways on the same or opposite side of the street. E Street is approximately 1,030 feet east of the signalized intersection of Jeffrey Road/Portola Parkway and approximately 870 feet west of the signalized intersection of Bee Canyon Access Road and Portola Parkway. As such, TDP-10 is met for this project driveway.

TDP-12: Traffic Signal Warrant

Table X summarizes the signal warrant analysis. As Table X indicates, traffic signals would be warranted at A, B, and C Streets under the Buildout Approved Plus Project condition, per TDP-12 (Warrant 3 - Peak Hour).

Although traffic signals are warranted at all three driveway locations on Jeffrey Road under Buildout conditions, a traffic signal is only recommended at A Street under the Buildout Approved Plus Project condition because of the following reasons:

LSA

Table X: TDP-12 Analysis Summary (Buildout Approved Plus Project)

Turn Movement	Jeffrey Road/A Street[1]		Jeffrey Road/B Street[1]		Jeffrey Road/C Street[1]	
	AM	PM	AM	PM	AM	PM
Northbound Left (NBL)	0	0	0	0	0	0
Northbound Through (NBT)	273	813	243	697	169	580
Northbound Right (NBR)	77	275	36	120	77	119
Southbound Left (SBL)	2	6	1	3	1	3
Southbound Through (SBT)	1,077	260	964	194	838	81
Southbound Right (SBR)	0	0	0	0	0	0
Eastbound Left (EBL)	0	0	0	0	0	0
Eastbound Through (EBT)	0	0	0	0	0	0
Eastbound Right (EBR)	0	0	0	0	0	0
Westbound Left (WBL)	280	175	115	72	127	116

Source: Compiled by LSA (2023).

[1] The Major Street (Jeffrey Road) has two-lane approaches.
The Minor Street (A/B/C Street) has a one-lane approach.

[2] 75 vehicles per hour applies as the lower threshold volume for a minor-street approach with one lane

- Considering the TDP-3 analysis results for the Buildout Approved Plus Project condition described before in this study, a traffic signal at A Street is recommended to provide a safe and efficient operation at this location, particularly related to left-turn in/out access. As for B and C Streets, the intersections would operate at a satisfactory LOS C with a one-way stop control installed on the project driveways (B and C Street).

- An internal driveway (D Street), as shown on Figure 2, provides internal connection for all driveways intersecting with Jeffrey Road or Portola Parkway. It allows residents living adjacent to B and C Streets to access Jeffrey Road via A Street, where a traffic signal is warranted and recommended.

- Additionally, a traffic signal is provided at the intersection of Jeffrey Road and Portola Parkway. As shown on Figure 29, the distance between Jeffrey Road/Portola Parkway and A, B, and C Streets is relatively short, approximately ranging from 750 feet to 1,120 feet. Multiple traffic signals within a short segment on Jeffrey Road would potentially result in an unnecessary breakdown in traffic flow.

TDP-14: Driveway Lengths

Per TDP-14, The minimum signalized driveway length should be 75 feet and should increase at a rate of 1 foot of storage per peak-hour vehicle (in 25-foot increments); the minimum unsignalized driveway length should be 25 feet and should increase at a rate of 1 foot of storage per peak-hour vehicle (in 25-foot increments). Figure 29 illustrates the minimum driveway lengths required to accommodate the inbound peak-hour traffic at each project driveway in accordance with TDP-14 criteria. The project applicant is aware that the minimum requirements for driveway lengths per TDP-14, as described below, should be incorporated into the project design.

Jeffrey Road/A Street. A Street is recommended as a signalized full-access driveway on Jeffrey Road. Application of the minimum signalized driveway length criteria contained in TDP-14 to the Buildout Plus Project peak-hour inbound traffic volumes shown on Figure 34 results in a recommended driveway length of 350 feet for the 79 a.m. or 281 p.m. peak-hour inbound vehicles entering A Street on Jeffrey Road.

Jeffrey Road/B Street. This is an unsignalized driveway proposed by this project on Jeffrey Road. Application of the minimum unsignalized driveway length criteria contained in TDP-14 to the Buildout Plus Project peak-hour inbound traffic volumes shown on Figure 34 results in a recommended driveway length of 125 feet for the 37 a.m. or 123 p.m. peak-hour inbound vehicles entering B Street on Jeffrey Road.

Jeffrey Road/C Street. This is an unsignalized driveway proposed by this project on Jeffrey Road. Application of the minimum unsignalized driveway length criteria contained in TDP-14 to the Buildout Plus Project peak-hour inbound traffic volumes shown on Figure 34 results in a recommended driveway length of 125 feet for the 78 a.m. or 122 p.m. peak-hour inbound vehicles entering C Street on Jeffrey Road.

E Street/Portola Parkway. This is an unsignalized RIRO driveway proposed by this project on Portola Parkway. Application of the minimum unsignalized driveway length criteria contained in TDP-14 to the Buildout Plus Project peak-hour inbound traffic volumes shown on Figure 34 results in a recommended driveway length of 100 feet for the 30 a.m. or 76 p.m. peak-hour inbound vehicles entering E Street on Portola Parkway.

Circulation Phasing

The City's *2020 Citywide Circulation Phasing Analysis Report* (LSA 2020) was reviewed to identify any deficient locations within the project study area. The City's analysis identified three locations for recommended improvements (Harvard Avenue/Michelson Drive, Bake Parkway/Jeronimo Road, and Jamboree Road/Portola Parkway). Only two locations (364: Bake Parkway/Jeronimo Road and 124: Jamboree Road/Portola Parkway) are within the project study area.

Based on the results presented in this Traffic Study, the proposed project would not result in any LOS impacts at the intersections identified above. As a result, study area improvements are not required as a part of the circulation phasing analysis.

Pedestrian Circulation

The City's *General Plan Circulation Element* lists three objectives that aim to support pedestrian circulation. Objective C-3 is "to maintain and enhance the pedestrian circulation system to support and encourage walking as a mode of transportation" (City of Irvine 2024). Objective C-5 is to "enhance the city's infrastructure to support and encourage walking, cycling, and other forms of active transportation by developing safe, accessible and interconnected networks of pathways, bike lanes, and multi-use trails throughout Irvine" (City of Irvine 2024). Objective C-6 is to "plan, develop, and maintain a trail network to support facilities that support the needs of cyclists, equestrian riders, and hikers" (City of Irvine 2024).

In the vicinity of the proposed project, sidewalks are currently provided on the south side of Portola Parkway and the west side of Jeffrey Road (south of Portola Parkway). JOST is located on the east side of Jeffrey Road (south of Portola Parkway).

A proposed extension of the JOST would form the western edge of the project site and would connect to the new South Park. A pedestrian bridge would cross over Portola Parkway as part of the JOST extension. The JOST extension would mark the easternmost end of the JOST, which runs through Irvine. A sidewalk on the north side of Portola Parkway along the project property frontage is proposed as a project design feature.

Bicycle Circulation

The City's *General Plan* includes a list of goals and objectives for bicycle planning. As stated in the *General Plan*, the bicycle circulation objective C-4 is to: "Plan, provide, maintain, and enhance a comprehensive bicycle network that encourages increased use of bicycles." (City of Irvine 2024). Objective C-5 is to "enhance the city's infrastructure to support and encourage walking, cycling, and other forms of active transportation by developing safe, accessible and interconnected networks of pathways, bike lanes, and multi-use trails throughout Irvine" (City of Irvine 2024). Objective C-6 is to

"plan, develop, and maintain a trail network to support facilities that support the needs of cyclists, equestrian riders, and hikers" (City of Irvine 2024).

On-street (Class II) bicycle lanes are currently provided on Portola Parkway and Jeffrey Road (south of Portola Parkway). The JOST is located on the east side of Jeffrey Road (south of Portola Parkway). A proposed extension of the JOST would form the western edge of the project site and would connect to the new South Park. Additionally, the cross-section measurement for Jeffrey Road north of Portola Parkway to C Street would be approximately 33 feet in each direction, which is wide enough to provide two through lanes with on-street bike lanes.

At the time this traffic study was prepared, an amendment to the bicycle parking requirements, as stated in the City's Zoning Ordinance, has not been finalized and approved by the Planning Commission and City Council. The project applicant is aware and is committed to providing bicycle parking amenities that meet the upcoming zoning ordinance update.

Transit Facilities

Objective C-7 of the City's General Plan aims to maintain a public transit system for trips within the City and to/from adjacent areas. OCTA provides 60 bus routes throughout Orange County. The bus network includes local, community, and express routes. Within the proximity of the project site, there are no transit routes and stops nearby in the existing condition. The closest bus stops are located at the northwest and southwest corners of Jeffrey Road/Irvine Boulevard, which are approximately 1 mile from the project site. These bus stops service OCTA Route 167, which provides transportation to and from these bus stops and throughout the cities of Orange and Irvine via Jeffrey Road and has stops at the major activity centers, such as the Village at Orange, Irvine Valley College, and University Center. In addition, Irvine CONNECT, a free shuttle service, is provided by the City to connect the northern end of Irvine to the Irvine Train Station via Yale Avenue, with stops at parks, schools, hospitals, and shopping centers. It should be noted that the updated site plan provided by the developer will include a new transit stop and bus turnout on Jeffrey Road at approximately the northeast corner of Jeffrey Road and C Street. This new transit stop will serve the expanded Irvine CONNECT route, to be implemented by the City, with the extension going adjacent to the Irvine Gateway project. The Irvine CONNECT and OCTA bus system maps and bus stop locations are provided in Appendix F.

Congestion Management Program Checklist

As presented in Table B, the proposed project is forecast to generate 10,825 daily trips. Although the proposed project would generate more than 2,400 daily trips, it is not expected to add more than 1,600 ADT to the direct access, or in close proximity, to a CMP Highway System. The closest CMP facility is Irvine Boulevard, approximately 1 mile from the project site. In addition, based on the results presented in this Traffic Study, all the CMP intersections within the NITM study area are forecast to operate at an acceptable LOS and the proposed project would not result in any LOS impacts at those CMP intersections based on an analysis of Short-Term traffic conditions that is required by the CMP. The City's *CMP Monitoring Checklist*: *Land Use Coordinator Component* is provided in Appendix G.

Vehicle Miles Traveled Analysis

Background

On December 28, 2018, the California Office of Administrative Law cleared the revised *State CEQA Guidelines* for use. Among the changes to the guidelines was removal of vehicle delay and LOS from consideration under CEQA. As a result of the final rulemaking surrounding Senate Bill 743 and the implementation deadline of July 1, 2020, a VMT analysis has been prepared in accordance with the City's adopted *Traffic Study Guidelines* (City of Irvine 2023).

Screening Criteria

Per the City's *Traffic Study Guidelines*, there are five types of screening criteria that lead agencies can apply to effectively screen projects from project-level assessment. These are summarized below:

1. The project requires an Addendum to a certified Environmental Impact Report (EIR) and can demonstrate that it is not subject to VMT analysis per *State CEQA Guidelines* Sections 15064.3 and 15007(c), and applicable guidance from the Governor's Office of Planning and Research.

2. The project results in a net increase of 250 or less weekday daily trips based on the latest edition of the ITE trip rates (or other trip generation rate approved by the City).

3. The project is located in a Transit Priority Area (i.e., located within 0.5 mile of an existing rail transit station or within 0.5 mile of two or more existing bus routes with a frequency of service interval of 15 minutes or less during morning and evening peak hours).

4. The project is 100 percent restricted affordable housing units.

5. The project is locally serving 100,000 square feet or less of retail use, daycare use, or a locally serving public school (kindergarten through 12th grade).

As previously mentioned, the project site is located north of Portola Parkway, east of Jeffrey Road, south of SR-241, and west of Bee Canyon Access Road, and there are no transit routes and stops within 0.5 mile. The proposed project includes approximately 1,360 residential units (408 single-family detached units and 952 multi-family units), which would generate 10,825 daily trips in total based on the ITE trip rates. In addition, 25 percent (340 units) of the total proposed units are affordable housing units. The proposed project cannot be screened out based on any of the adopted screening criteria.

Analysis

Since the proposed project does not screen out based on any of the above criteria, a VMT analysis is required. The VMT analysis was prepared, and the results are provided in Appendix H. Table Y below presents a summary of the VMT analysis results. As shown in Table Y, the proposed project is required to reduce its VMT by 25.7 percent and is presumed to have a significant CEQA transportation impact.

Table Y: Project VMT Analysis Result

VMT Analysis Scenario	VMT Rate	
	VMT	Metric
VMT Threshold Goal[1]	14.88	VMT per capita
Project VMT Rate[2]	20.03	VMT per capita
Above or Below Citywide VMT Threshold	**Above**	
Significant Impact?	**Yes**	
VMT Reduction Required	**25.7%**	

Source: Compiled by LSA (2024).
[1] Per the City of Irvine *Traffic Study Guidelines* (March 21, 2023).
[2] Project VMT analysis is provided in Appendix H.
VMT = vehicle miles traveled

VMT Mitigation Measures

Since a significant VMT impact (25.7 percent) has been identified for the residential project, potential mitigation measures to reduce the project's VMT impact to a level at or below the City's threshold must be identified. According to the City's *Traffic Study Guidelines*, all feasible mitigation measures must be incorporated into the project to substantially reduce the impact even if the project cannot meet the adopted VMT threshold.

The California Air Pollution Control Officers Association (CAPCOA) *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity* (December 2021) (CAPCOA Handbook) is utilized for identifying the various mitigation strategies and methods to quantify VMT reductions. The CAPCOA VMT reduction strategies include built environment changes and transportation demand management (TDM) actions. The TDM strategies are separated into seven subsectors: Land Use, Trip Reduction Programs, Parking or Road Pricing/Management, Neighborhood Design, Transit, Clean Vehicles and Fuels, and School Programs.

Effectiveness levels for multiple measures within a subsector may be calculated to determine a combined effectiveness level. CAPCOA recommends that measures reductions within a subsector be multiplied. This will take the following form:

$$\text{Reduction}_{\text{subsector}} = 1 - [(1 - A) * (1 - B) * (1 - C)]$$

A, B, and C are the individual measures reduction percentages for the measures to be combined in each subsector. In addition, each subsector has a maximum allowable reduction.

CAPCOA also adopts 70 percent as a maximum for the combined VMT impact from the following four subsectors: Land Use, Neighborhood Design, Parking or Road Pricing/Management, and Transit ($\text{Reduction}_{\text{multi-subsector}} = 1 - [(1 - \text{Land}) * (1 - \text{Design}) * (1 - \text{Parking}) * (1 - \text{Transit})] \leq 70\%$).

Three mitigation measures (T-4, T-18, and T-20, as listed below) were identified as applicable measures for the proposed project. Other potential VMT mitigation measures were also reviewed but ruled out because of the nature of the proposed use and the lack of ongoing control that the property developer has with respect to implementation.

- **Land Use:**
    - **T-4 (Integrate Affordable and Below Market Rate Housing):** Up to a 28.6 percent maximum VMT reduction. Individuals living in affordable multi-family housing have lower rates of car ownership and higher rates of other transportation modes, such as transit, bicycling, and walking.
- **Neighborhood Design:**
    - **T-18 (Provide Pedestrian Network Improvement):** Up to a 6.4 percent maximum VMT reduction. Providing sidewalks and an enhanced pedestrian network encourages people to walk instead of drive, and this mode shift results in a reduction in VMT.
    - **T-20 (Expand Bikeway Network):** Up to a 0.5 percent maximum VMT reduction. Providing bike lanes and an enhanced bikeway network can increase access to and from transit hubs. This encourages a mode shift from vehicles to bicycles and displaces VMT.

Since 25 percent of the total proposed units are affordable housing units, as previously stated, Mitigation Measure T-4 will reduce the VMT impact no more than 7.15 percent (28.6 percent * 25 percent). In addition, per the City's *Traffic Study Guidelines,* the City allows for a 2.5 percent VMT reduction related to pedestrian and bicycle connectivity. As such, the combination of Mitigation Measures T-18 and T-20 would provide a maximum VMT reduction of 2.5 percent. Assuming each mitigation measure could achieve its maximum VMT reduction value, the implementation of these three mitigation measures could reduce VMT by a total of 9.5 percent, which is less than the project's VMT impact of 25.7 percent. Therefore, the proposed project will have a significant unavoidable VMT impact.

$$\text{Reduction}_{\text{multi-subsector}} = 1 - [(1 - \text{Land}) * (1 - \text{Design})]$$
$$= 1 - [(1 - 28.6\% * 25\%) * (1 - 2.5\%)]$$
$$= 9.5\%$$

The VMT mitigation measures mentioned in the *CAPCOA Handbook,* as well as the City's *Traffic Study Guidelines*, would not reduce the total VMT increase caused by this proposed residential project below the VMT Impact Threshold. Therefore, this project would result in a significant transportation (CEQA) impact, and a Statement of Overriding Considerations must be considered for adoption and is a part of the CEQA document (EIR) prepared for this project.

Jeffrey Road Extension Feasibility Analysis

A planned extension of Jeffrey Road, between C Street and the SR-241 Toll Road and further north to Santiago Canyon Road, is currently designated on the City's Circulation Plan and OCTA's MPAH. Figure 35 shows the location of the Jeffrey Road extension. A separate feasibility analysis is prepared to evaluate with and without the proposed roadway extension and is provided in Appendix I.

Jeffrey Road Extension Location

REQUIRED IMPROVEMENTS AND/OR RECOMMENDATIONS

Based on the results of the LOS analysis, the proposed project may potentially result in an LOS impact at the following location, and the corresponding physical improvement is required:

- **I-5 SB On-Ramp at Jeffrey Road under the Long-Range Approved Scenario:** The conversion of the HOV preferential on-ramp to a second metered mixed-flow lane at this ramp location will increase the on-ramp capacity and reduce the project's LOS impact. The project will participate in the implementation of this identified NITM mitigation improvement on a fair-share basis to mitigate its impact, and a 1.62 percent fair-share contribution would be required.

Based on the results of the access analysis for the Buildout Approved scenario, a traffic signal would be warranted and recommended at A Street on Jeffrey Road if and when the extension of Jeffrey Road to SR-241 is built, in order to satisfy both TDP-3 and TDP-12 criteria in the Buildout condition.

CONCLUSIONS

The LOS evaluation of the intersections, arterial roadway segments, and freeway/tollway ramps and mainline segments within the NITM study area shows that the addition of project traffic to Existing, Short-Term Approved, and Buildout Approved conditions would not create any LOS impacts. However, the proposed project will result in an LOS impact at the I-5 SB on-ramp at Jeffrey Road in the Long-Range Approved condition. Converting the HOV preferential on-ramp to a second metered mixed-flow lane at this ramp would mitigate the project's LOS impact. The project will be responsible for a fair-share commitment towards implementation of this identified NITM improvement.

A site access analysis, consistent with the City's TDPs, was conducted for the project for both Existing and Buildout Approved scenarios. The summary of access analysis results for each scenario has been described below.

Existing Baseline and Plus Project Scenario

This scenario does not include the Jeffrey Road extension. Under this scenario, Jeffrey Road between Portola Parkway and C Street was recently constructed as a four-lane Primary roadway and terminates near C Street (approximately 3,100 feet north of Portola Parkway). The cross section of Jeffrey Road includes an on-street bike lane on both sides of the street and an NB de-facto right-turn lane at each project driveway (which would satisfy TDP-4 criteria). No impacts to vehicle access were identified using the following design guidelines with the recommendations provided in this Traffic Study:

- **TDP-1:** Turn Lane Pocket Lengths
- **TDP-3:** Left-Turn In/Out Access
- **TDP-4:** Right-Turn Lanes at Uncontrolled Driveways
- **TDP-10:** Distance between Driveways and Intersections
- **TDP-14:** Driveway Lengths

A traffic signal is not warranted based on expected traffic conditions at any of the proposed project access points from Jeffrey Road in the Existing Plus Project scenario, per TDP-12 criteria. A one-way stop control is proposed for A, B, and C Streets at Jeffrey Road in the existing condition.

Buildout Approved Baseline and Plus Project Scenario

This scenario does include the Jeffrey Road extension from C Street to SR-241 and further north to Santiago Canyon Road. Under this scenario, a traffic signal would be warranted and recommended at A Street on Jeffrey Road to satisfy both TDP-3 and TDP-12 criteria. In addition to a four-lane Primary facility for Jeffrey Road, an NB de-facto right-turn lane is provided at A, B, and C Streets on Jeffrey Road to satisfy TDP-4 criteria. No impacts to vehicle access were identified using the following design guidelines with the recommendations provided in this Traffic Study:

- **TDP-1:** Turn Lane Pocket Lengths
- **TDP 3:** Left-Turn In/Out Access
- **TDP 4:** Right-Turn Lanes at Uncontrolled Driveways
- **TDP-10:** Distance between Driveways and Intersections
- **TDP-14:** Driveway Lengths

A Traffic signal is warranted at A, B, and C Streets on Jeffrey Road in the Buildout Approved Plus Project scenario, per TDP-12 criteria. However, only a traffic signal at A Street is recommended in the Buildout condition, if and/or when Jeffrey Road is extended north to SR-241, based on several factors, including the distance between driveways, the peak-hour traffic volumes primarily at A Street, and the internal circulation (i.e., D Street) that would allow project vehicles to access the proposed signal at A Street. A one-way stop control is proposed for B and C Streets at Jeffrey Road in the buildout condition.

The proposed project would maintain the existing walkways/sidewalks, on-street (Class II) bicycle lanes, and JOST in the vicinity of the project site. A proposed extension of the JOST would form the western edge of the project site and would connect to the new South Park. A pedestrian bridge would cross over Portola Parkway as part of the JOST extension. The JOST extension would mark the northernmost end of the JOST, which runs through Irvine. A sidewalk on the north side of Portola Parkway, along the project property frontage, is proposed as a project design feature. In addition, there are no transit routes and stops within 0.5 mile of the project site in the existing condition. The closest bus stops are located at the northwest and southwest corners of Jeffrey Road/Irvine Boulevard, which are approximately 1 mile away from the project site. The updated site plan provided by the developer will include a new transit stop and bus turnout on Jeffrey Road at approximately the northeast corner of Jeffrey Road and C Street. This new transit stop will serve the expanded Irvine CONNECT route, to be implemented by the City, with the extension going adjacent to the Irvine Gateway project.

Based on the City's *Traffic Study Guidelines*, the proposed project is required to reduce its VMT by 25.7 percent and is presumed to have a significant CEQA transportation impact. Three applicable VMT mitigation measures identified from the *CAPCOA Handbook,* as well as the City's *Traffic Study Guidelines*, include T-4 (Integrate Affordable and Below Market Rate Housing), T-18 (Provide Pedestrian Network Improvement), and T-20 (Expand Bikeway Network). Assuming each mitigation

measure could achieve its maximum VMT reduction value, the implementation of these three mitigation measures could reduce VMT by a total of 9.5 percent, which is less than the project's VMT impact of 25.7 percent. As a result, the proposed project will have a significant unavoidable VMT impact. Therefore, a Statement of Overriding Considerations must be considered for adoption and is a part of the CEQA document (EIR) prepared for this project.

APPENDIX A

APPROVED SCOPE OF WORK

IRVINE GATEWAY VILLAGE
TRAFFIC STUDY SCOPE OF WORK

The purpose of this Scope of Work is to define the methodology and requirements for a Traffic Study for approximately 1,360 residential dwelling units and 100 acres of public park use within the Irvine Gateway Village portion of the City of Irvine (City). The project site is located north of Portola Parkway, east of Jeffrey Road, south of SR-241 and west of Bee Canyon Access Road.

The Irvine Gateway Village is planned to result in the development of an approximately 61-acre residential village with adjacent parks, trails, and open space preserves. Besides the residential component, the project includes a new park, called South Park. A proposed extension of the Jeffrey Open Space Trail (JOST) would form the western edge of the project site and would connect to the new South Park. A pedestrian bridge would cross over Portola Parkway as part of the JOST extension. The JOST extension would mark the easternmost end of the JOST, which runs through the City. A linear park area along Bee Canyon Access Road would be created as well. For purposes of the traffic study, the total area of added public parks and open space areas would be approximately 100 acres. The project requires a General Plan Amendment, Zone Change, Master Plan and Tentative Tract Maps.

The Traffic Study will determine the potential short-term, long-range and buildout traffic level of service (LOS) impacts resulting from the development of approximately 1,360 residential dwelling units (including 408 single-family detached units and 952 multi-family units) and 100 acres of public park use on the vacant property. The project will provide 25% affordable units (340 units). The design of the proposed project (including the access, circulation, and layout of the site plan) is subject to the findings of the Traffic Study. The study will also include an assessment of Vehicle Miles Traveled (VMT), which is the metric used to determine potential California Environmental Quality Act (CEQA) impacts for transportation.

Access to the project site will be provided via driveways along Jeffrey Road (north of Portola Parkway) and a right turn in/out only (RIRO) driveway onto Portola Parkway (east of Jeffrey Road). This Scope of Work outlines the tasks necessary for the preparation of a Traffic Study. The Traffic Study will be developed in accordance with the applicable sections of the City's Traffic Study Guidelines (March 2023), North Irvine Transportation Mitigation (NITM) requirements (City Council Ordinance No. 03-61) and the City's Transportation Design Procedures (TDPs) (February 2007) and will include the following key elements.

I. EXECUTIVE SUMMARY

This section of the Traffic Study will provide a short, clear, and concise description of the project and analysis findings. The project recommendations and mitigation measures will also be included in this section, if necessary.

Sun-Sun Tveaten Murillo 8/15/24
Approved by Development Review

II. INTRODUCTION

This section will include a comprehensive description of the project and key elements of the Traffic Study, including planning area description, general terrain features, and approved and proposed uses on site. The specific surrounding land uses on each adjacent parcel will also be described. The following elements are identified for the purpose of conducting the Traffic Study.

A. Project Site

A project location and study area map (Figure 1, attached) is attached to this Scope of Work and will be provided in the Traffic Study. The project site is located north of Portola Parkway, east of Jeffrey Road, south of SR-241 and west of Bee Canyon Access Road. Access to the site will be provided via Jeffrey Road and a RIRO driveway on Portola Parkway. A preliminary site plan is illustrated in Figure 2 (attached).

B. Study Area Boundary

The study area will include the intersections, roadway segments, freeway mainline and freeway ramps required for analysis under the NITM requirements and included in the City's traffic model (Irvine Transportation Analysis Model [ITAM TC V1.8]). The study area will be confirmed with City staff prior to the analysis.

If significant project traffic distribution is identified at the boundary of the initial study area, the analysis area will be expanded accordingly.

C. Existing, General Plan, and Proposed Site Uses

Existing site uses, zoning and proposed land uses shall be described.

III. PERFORMANCE CRITERIA

The performance criteria to determine potential project effects and improvements will be consistent with the City's criteria, as approved by the City (March 2023). Also, the most recently approved peak-hour link capacity methodology will be utilized for evaluating roadway capacity conditions and the need for improvements (if necessary). The City's TDPs will be used as the performance criteria to evaluate the design features of the proposed project accesses and internal circulation.

IV. EXISTING CONDITIONS

A. Existing Site Uses

Existing and approved land uses on site will be identified.

B. Existing Roadways and Intersections

The characteristics of the site's surrounding roadway network will be surveyed to verify the existing number of lanes, traffic signal locations, intersection configurations, and other visible factors that may have to be included in the analysis.

Sun-Sun Tveden Murillo 8/15/24
Approved by Development Review

Existing roadway volumes, volume-to-capacity (v/c) ratios, and level of service (LOS) at intersections will be included for the above roadways and intersections. The Intersection Capacity Utilization (ICU) and Highway Capacity Manual (HCM) methodologies will be used for signalized and unsignalized intersections, respectively. Freeway mainline and ramp locations will be based on a v/c calculation, consistent with the City's NITM Ordinance. The LOS analysis tables will include ITAM TransCAD (ITAM TC V1.8) intersection and link numbers for each study area intersection and roadway segment.

V. ANALYSIS METHODOLOGY/APPROACH

Existing traffic volume data within the study area (peak hour intersection counts and daily roadway segment volume) will be obtained from the City. Traffic data for Caltrans facilities will be obtained through the Caltrans Performance Management System (PeMS).

Study area intersections will be analyzed using the adopted ICU methodology for signalized intersections and the HCM methodology for unsignalized intersections. The roadway segments between the intersections will also be analyzed in the report. Daily traffic volumes and v/c ratios will be presented in the analysis for these roadway segments. A peak-hour link analysis will be conducted for roadway segments where the "plus project" LOS is LOS E and the project contributes greater than 0.02 to the v/c ratio. Roadway v/c ratios will also be prepared for freeway mainline and ramp locations.

The criteria to evaluate arterial roadways, intersections, freeway/tollway mainline segments and freeway/tollway ramps outside of Irvine are based on the LOS calculation methodologies and performance standards that have been adopted by the governing jurisdictions in the study area and by the OCTA as part of the CMP. When analyzing individual locations on the study area circulation system, the criteria of the jurisdiction in which a given facility is located will be applied, consistent with the City's NITM Ordinance.

The approved TransCAD version of the ITAM (V1.8) will be used for conducting all model runs. The following ITAM TC V1.8 future runs will be conducted by LSA:

- Short-Term Interim-Year Approved Baseline
- Short-Term Interim-Year Approved Baseline Plus Project
- Long Range Approved Baseline
- Long Range Approved Baseline Plus Project
- Buildout Approved Baseline
- Buildout Approved Baseline Plus Project
- Buildout Pending Baseline
- Buildout Pending Baseline Plus Project

Note – two additional model runs will be conducted as part of a Jeffrey Road Extension Feasibility Analysis, described in Section X. of this scope of work.

Sun-Sun Tveaten Murillo 8/15/24
Approved by Development Review

The future conditions described above are based on the roadway network and land use assumptions envisioned to be in place. City staff has incorporated all approved projects to be analyzed for the cumulative setting in the ITAM TC V1.8.

City staff will make all necessary land use and network changes for the baseline (approved) scenarios and will provide LSA with the baseline ITAM TC V1.8 files. LSA will prepare the forecast "plus project" ITAM TC V1.8 data. A description of any changes to the ITAM TC V1.8 for this project will be provided to the City for review. The ITAM TC V1.8 data will be post-processed and used in the LOS analysis.

VI. FUTURE TRAFFIC CONDITIONS

LSA will analyze the project LOS effects on the study area intersections, roadway segments and Caltrans mainline/ramp locations for the Short-term Interim-year, Long Range and Buildout Approved conditions.

LSA will request the future baseline ITAM TC V1.8 from City staff. LSA will revise the land use and incorporate network changes related to the "plus project" scenario. These ITAM runs will include the following scenarios:

1. **Short-Term Interim-Year Approved Baseline:** The ITAM TC V1.8 run will include each application for development approved by the City. Any additional development beyond the existing uses for the project that might be assumed in ITAM TC V1.8 will be deleted for the analysis of this scenario.

2. **Short-Term Interim-Year Baseline Plus Project:** The ITAM TC V1.8 run will include each application for development approved by the City. The 1,360 residential dwelling units, including 408 single-family detached units and 952 multi-family units, will be included in TAZ 77 (ITAM TC)/TAZ 58 (ITAM 15). The 100 acres of public park use will be included in TAZ 14 (ITAM TC)/TAZ 12 (ITAM 15).

3. **Long Range Approved Baseline:** The ITAM TC V1.8 run will include each application for development approved by the City. Any additional development beyond the existing uses for the project that might be assumed in ITAM TC V1.8 will be deleted for the analysis of this scenario.

4. **Long Range Baseline Plus Project:** The ITAM TC V1.8 run will include each application for development approved by the City. The 1,360 residential dwelling units, including 408 single-family detached units and 952 multi-family units, will be included in TAZ 77 (ITAM TC)/TAZ 58 (ITAM 15). The 100 acres of public park use will be included in TAZ 14 (ITAM TC)/TAZ 12 (ITAM 15).

5. **Buildout Approved Baseline:** The ITAM TC V1.8 run will include each application for development approved by the City. Any additional development beyond the existing uses for

Sun-Sun Tveiten Murillo 8/15/24
Approved by Development Review

the project that might be assumed in ITAM TC V1.8 will be deleted for the analysis of this scenario.

6. **Buildout Baseline Plus Project:** The ITAM TC V1.8 run will include each application for development approved by the City. The 1,360 residential dwelling units, including 408 single-family detached units and 952 multi-family units, will be included in TAZ 77 (ITAM TC)/TAZ 58 (ITAM 15). The 100 acres of public park use will be included in TAZ 14 (ITAM TC)/TAZ 12 (ITAM 15).

7. **Buildout Pending Baseline:** The ITAM TC V1.8 run will include each application for development currently approved and under review by the City. Any additional development beyond the existing uses for the project that might be assumed in ITAM TC V1.8 will be deleted for the analysis of this scenario.

8. **Buildout Pending Plus Project:** The ITAM TC V1.8 run will include each application for development currently approved and under review by the City. The 1,360 residential dwelling units, including 408 single-family detached units and 952 multi-family units, will be included in TAZ 77 (ITAM TC)/TAZ 58 (ITAM 15). The 100 acres of public park use will be included in TAZ 14 (ITAM TC)/TAZ 12 (ITAM 15).

LSA will utilize the ITAM TC V1.8 to analyze these conditions at study area intersections, roadway segments and Caltrans facilities. In addition, City staff will review the ITAM TC V1.8 network and land uses for the baseline and "plus project" scenario to ensure that it accurately reflects the project impacts prior to the model runs. LSA will provide an electronic copy of the "plus project" ITAM TC V1.8 runs with the Traffic Study to the City/Project Manager for review.

Project LOS impacts will be identified at study area intersections for the Short-term Interim-Year, Long Range and Buildout Approved conditions, assuming improvements to the circulation system identified by the City. Daily traffic volumes and v/c ratios will also be presented in the analysis for the study area roadway segments for each scenario. The City's peak-hour link analysis (per the adopted City Traffic Study Guidelines) will be utilized for evaluating roadway capacity conditions and the need for improvements (if necessary). The peak-hour link analysis will determine directional a.m. and p.m. peak-hour v/c ratios for each link which is projected to exceed LOS standards. The peak-hour capacity will be determined by multiplying the midblock number of lanes for each direction by a lane capacity of 1,600 vehicles per hour. Where the distance between controlled intersections is one or more miles, the midblock number of lanes shall be multiplied by a lane capacity of 2,000 vehicles per hour.

VII. PROPOSED PROJECT IMPACTS

A. Trip Generation

LSA will generate a.m. peak-hour, p.m. peak-hour, and daily trips for the project land uses using trip rates from the ITE Trip Generation manual (10th Edition), consistent with the latest version of the ITAM model. This information will be provided in tabular form (Table A, attached).

Sun-Sun Tveaten Murillo 8/15/24
Approved by Development Review

B. Adjustments to Trip Generation

No adjustments to the trip generation shall be made without prior written approval from the City.

C. Trip Distribution and Trip Assignment

The directions of approach to and departure from the site will be obtained based on an ITAM TC V1.8 select zone analysis conducted for Buildout Approved Baseline Plus Project a.m. peak-hour, p.m. peak-hour, and daily conditions. Any revisions to the project TAZ centroid connectors or refinements to the project trip distribution based on the locations and layout of the project driveways shall be completed in coordination with City staff. A map indicating regional directions of trip distribution will be presented in the Traffic Study.

VIII. PHASING

The proposed project will be completed in a single phase.

IX. SPECIAL ANALYSES/ISSUES

A. Access Analysis

An access analysis of the proposed project driveways on Jeffrey Road (full access) and Portola Parkway (RIRO) will be performed. LSA will review project volume forecasts and determine the adequacy of the interface with the arterial street system using the City's TDPs.

For purposes of the access analysis, the project will include 1,360 residential dwelling units, including 408 single-family detached units and 952 multi-family units, and 100 acres public park use. The project net peak-hour trips, per ITE trip rates, will be assigned in and out of the project access driveways. Trip distribution and driveway allocation will be determined using the distribution patterns from the most recent version of the ITAM TC V1.8 model. An exhibit will be provided that shows the existing without project and existing plus project turning volumes at the access driveways to the project site. The exhibit will depict the driveways, as well as any adjacent and/or opposing driveways. The exhibits will be drawn roughly to scale, with the distances between driveways and intersections dimensioned. The adjacent and opposing driveways to the project site will be included as part of the access analysis.

The internal circulation analysis will address specific design requirements of the City based on the proposed access plan and the project trip assignment. This analysis is to ensure that the project will continue to meet or exceed the requirements within the City's TDPs. Specific design features to be evaluated include:

- **Turn-lane Pocket Lengths (TDP-1)** – SBL and EBL at Jeffrey Road/Portola Parkway.
- **Left Turn-in/out Access (TDP-3)** – the project driveways on Jeffrey Road.
- **Right Turn Lanes at Uncontrolled Driveways (TDP-4)** – project driveways.
- **Distances between Driveways (TDP-10)** – project driveways.
- **Traffic Signal Warrant (TDP-12)** – project driveways on Jeffrey Road.

Sun-Sun Tveaton Murillo 8/15/24
Approved by Development Review

- **Driveway Lengths (TDP-14)** – project driveways.
- **Gate Stacking (TDP-15)** – project driveways (if necessary)

A summary of the proposed project and results of the analysis will be prepared. Based upon these results, recommendations will be presented for the design of the project access driveways and interface with adjacent streets. These recommendations will be consistent with the City's TDPs.

B. Circulation Phasing

An analysis of any deficient intersections identified in the City's 2020 Circulation Phasing Analysis Report within the project study area (if any) will be included in this section.

C. Pedestrian Circulation

The pedestrian circulation on site and connection to the adjacent public facilities and corresponding traffic control measures within the project site will be discussed in this section. The Traffic Study will include a discussion of how policies a, b, and c of General Plan Objective B-3 will be met with implementation of this project.

D. Bicycle Circulation

Bicycle circulation on site and connection to adjacent bicycle facilities will be discussed in this section. LSA will document how the project will conform to applicable policies of Objective B-4 of the City's General Plan.

E. Transit Facilities

The Traffic Study will identify the transit facilities (e.g., OCTA bus, iShuttle, Irvine Connect) within the project vicinity. If a bus stop is located adjacent to the project site, LSA will discuss pedestrian access and bus stop turnout design per City guidelines.

F. Vehicle Miles Traveled (VMT) Analysis

LSA will conduct the appropriate level of VMT analysis, if required, based on the City's adopted Traffic Study Guidelines. The need for a VMT analysis is subject to the determination of the appropriate level of CEQA analysis required for the project.

If needed, a VMT analysis will be prepared to calculate the project's VMT based on the approved version of the ITAM TC V1.8. The project VMT will be compared to the regional VMT to determine potential CEQA impacts. The results of this analysis will identify if the proposed project has a less-than-significant impact or if mitigation is required to reduce the VMT.

X. JEFFREY ROAD EXTENSION FEASIBILITY ANALYSIS

A planned extension of Jeffrey Road, between Portola Parkway and SR-241 Toll Road, is currently designated on the City's Circulation Plan and OCTA's Master Plan of Arterial Highways (MPAH). A feasibility analysis will be prepared to evaluate with and without the proposed roadway extension. This sensitivity analysis will require two additional ITAM TC V1.8 model runs:

Sun-Sun Tveaten Murillo 8/15/24
Approved by Development Review

- Buildout Approved With Project (without Jeffrey Road extension from Portola Parkway to SR-241).
- Buildout Pending With Project (without Jeffrey extension from Portola Parkway to Santiago Canyon Road).

LSA will evaluate these model runs and analysis of all study area to determine potential impacts associated with the elimination of the planned roadway extension. Should any study area location require improvements, LSA will summarize potential mitigation to offset the LOS impacts.

LSA will also prepare a VMT analysis to evaluate potential impacts of the removal of the Jeffrey Road Extension (Portola Parkway to SR-241) under the With Project scenario. LSA will coordinate the model runs and results with City of Irvine Transportation modeling staff.

XI. REQUIRED MITIGATION MEASURES AND/OR RECOMMENDATIONS

Based on the results and in accordance with the adopted City Traffic Study Guidelines, physical, operational, and/or alternative improvements required to offset any potentially adverse effects due to the proposed project will be identified.

XII. CONCLUSIONS

A summary of the results of the analysis and recommendations will be prepared.

XIII. REVISIONS TO ANALYSIS

Revisions to the Traffic Study will be provided in response to the City's comments.

XIV. SIGNATURE

The Traffic Study will be prepared under the supervision of, and signed, stamped, and dated by, a registered traffic engineer or a registered professional civil engineer with appropriate engineering and/or planning credentials.
